In the Name of God, the Lord of Knowledge and Wisdom

Traffic in the Niyaee Planetary City

(Complimentary Volume)

Written by: Reza Niyaee

"We do not think of the Country; we think of the Earth itself".

"To all the dwellers of the five continents of the Earth,

with a heartfelt wish for a world abundant in justice and serenity for every soul".

Introduction

The Niyaee Planetary City: A Fundamental Reconsideration of the Concept of City, Human, and Future.

A city is more than a mere aggregation of buildings, streets, and infrastructure; it is a mirror reflecting humanity's contemplation of life itself. Each epoch crafts its own city—a city that embodies the values, technologies, fears, and aspirations of its time. While contemporary modern cities outwardly symbolize progress, speed, and technology, they harbor deeper crises that challenge the quality of life for the modern human: crippling traffic, air pollution, pervasive anxiety, social fragmentation, psychological insecurity, excessive dependence on the automobile, environmental degradation, and the relentless waste of time.

Within this context, the "Niyaee Planetary City" emerges not as a superficial modification or fleeting urban trend, but as a radical redefinition of the very concept of city; a city that anew asks:

For whom is the city being built? For the automobile or for the human? For energy consumption or for

sustainable living? For aimless speed or for quality of life?

The Niyaee Planetary City offers a structural, technological, and profoundly human response to these questions—a response born from the disillusionment of car-centric cities and opening a new horizon for urban living.

One of the most fundamental decisions within the Niyaee Planetary City is the complete elimination of the automobile from the city's surface. This decision, seemingly radical at first glance, is in truth a rational response to one of the deepest crises of the modern city. Despite the development of highways, intersections, squares, and complex traffic management systems, today's cities remain ensnared in traffic, accidents, noise pollution, and psychological fatigue. The automobile, once a symbol of freedom, has become a source of stress, insecurity, and wasted time.

The Niyaee Planetary City breaks this vicious cycle. Here, the automobile is not eliminated or denied, but rather moved beneath the city's surface—without intersections, traffic lights, signs, or squares. An underground network, intelligent, autonomous, and

powered by artificial intelligence, handles the movement of goods and essential travel. These subterranean vehicles operate on clean energy sources (electric, solar, wind, and hybrid) and, through intelligent algorithms, function without accidents, delays, or interference.

The result is the birth of an urban surface returned to humanity—a surface safe, tranquil, silent, and tangible.

One paradox of the modern city is that the more signs, rules, and regulations proliferate, the greater the chaos becomes. The Niyaee Planetary City, leveraging artificial intelligence, the Internet of Things, and intelligent platforms, reverses this logic. With an autonomous and integrated transportation system, there is no longer a need for intersections, squares, or traffic lights; decision-making is delegated from fallible humans to an intelligent, precise, and instantaneous system.

This shift not only increases the city's efficiency but also guarantees the psychological well-being of its citizens. The Niyaee Planetary City is a place where movement flows without tension, without fear, and without destructive competition—a city where order is

the result of intelligence, not coercion.

The Niyaee Planetary City is, at its core, an eco-centric city—not in rhetoric, but in structure. The elimination of fossil fuel vehicles, the absence of polluting industries within the city, the prohibition of heavy vehicle traffic, and the complete relocation of industrial and logistical centers outside the city, have resulted in air, noise, and environmental pollution being reduced to near zero.

The energy needs of the city, both residential and in the surrounding industrial areas, are met by clean sources: sun, wind, electricity, and geothermal energy. This energy independence transforms the Niyaee Planetary City into a sustainable and resilient model in the face of global energy and climate crises.

Furthermore, the presence of extensive water channels within the city's structure not only enables waterborne transport by boat, but also plays a vital role in air purification, humidity regulation, and the enhancement of the urban climate—an advantage lost in most modern cities worldwide.

While fifteen-minute cities represent an effort to reduce distance, the Niyaee Planetary City takes a further step

with a five-minute approach. In this city, all essential life services—from education and healthcare to shopping, recreation, work, and social interaction—are within a five-minute reach.

This rapid accessibility not only eliminates dependence on the automobile but also achieves spatial equity. Children, the elderly, people with disabilities, and car-free citizens all benefit equally from the city. The neighborhood once again becomes the core of life, and the city transforms from a scattered collection into a vibrant network of human units.

In the Niyaee Planetary City, time lost in traffic is transformed into time lived—time for life, creativity, interaction, and tranquility.

One of the most innovative aspects of the Niyaee Planetary City is its water-centric nature. Unlike conventional land-centric cities, this city draws inspiration from the logic of a ship—a circular, systemic, and integrated order in which transportation, logistics, energy, and human life are designed in complete harmony with water.

All commodity inputs are handled via the sea. Loading docks are located in the first ring of the city, and after

unloading, goods are transported to various parts of the city through underground autonomous systems. This model not only eliminates traffic and pollution but also transforms water-based economy, maritime trade, fisheries, and tourism into the driving force of the city.

Security in the Niyaee Planetary City is the result of eliminating danger, not increasing control. The absence of automobiles on the city's surface eliminates the risk of accidents. Children, the elderly, and citizens move freely and confidently in public spaces. Walking, cycling, scootering, and boating are not secondary activities but the primary modes of urban living.

This physical security leads to psychological security—a city where fear gives way to trust, and public spaces once again become arenas for collective life.

The Niyaee Planetary City is neither a derivative imitation of Western models nor a repetition of modern cities with a new facade. It is the result of a deep study of the shortcomings, crises, and failures of contemporary urban planning, combined with cutting-edge technologies, artificial intelligence, and a nature-centric logic.

Niyaee is a city that puts the automobile to service, not the other way around; a city that returns time to humanity; a city that brings water, intelligence, and humans together in a harmonious system. It is an invitation to rethink the way we live—a reminder that the future of the city is not built with concrete and steel alone, but with wisdom, human-centeredness, and respect for nature.

Chapter One: A City Unbound; A City Without Cars

Old cities, before they weary us, first exhaust the mind. Before they turn the sky to gray, they darken the soul. And before they fill the streets, they drain the heart of peace.

In the modern cities of the twentieth and twenty-first centuries, the automobile evolved not merely into a means of transport, but gradually into a dominant force—a silent, pervasive reign. Streets were designed for cars, not for people. Sidewalks narrowed, green spaces retreated, children vanished from the alleys, and families learned to divide their lives between horns, red lights, anxiety of delay, and the fear of accidents.

The city ceased to be a place of living; it became a place of transit. And the human being ceased to be a resident of the city; they were a weary traveler, fleeing each day from home to a destination. Amidst this, traffic was not merely a gathering of cars; it was a convergence of discontent, suppressed anger, wasted time, and dissipated energy.

Each intersection formed a knot in the mind, and each red light an imposed pause in a flow of life that was no

longer natural. Neuroscience would later prove that constant exposure to traffic, the blare of horns, sudden stops, and moment-to-moment decision-making were among the hidden factors contributing to increased anxiety, aggression, depression, and mental fatigue in city dwellers.

Yet, cities did not change; for changing a city required a change in thinking.

The **Planetary** vision of **Niyaee** began from this very point: from this simple yet fundamental question:

“Is the presence of cars on the city’s surface truly a necessity, or merely a historical habit?”

In **Niyaee**, the answer was clear.

Cars were not eliminated, but rather returned to their rightful place. The city surface was reclaimed by humanity. The earth breathed. And the city was redefined. In **Niyaee**, the city surface is no longer a thoroughfare for machines, but a foundation for life—a place for walking, pausing, conversing, children playing, families moving with grace, and a natural connection between humans and their environment.

Movement within the city is facilitated by smart

bicycles, electric and wind scooters, pedestrian-centric pathways, tranquil boats gliding through canals, and cable cars that move silently through the air, powered by solar and wind energy.

In this city, the dominant sound is that of nature:

The sound of water, wind, footsteps, and laughter.

But cars still exist; not as masters of the city, but as a hidden servant. All vehicles have been moved to the subsurface layers of the city—multiple, interconnected layers, without intersections, squares, traffic lights, or signs. Movement within this underground network is entirely autonomous, intelligent, and powered by clean energy.

No one makes moment-to-moment decisions, there is no overtaking, and no sudden stops occur. **Niyaee's** subterranean transit system is designed based on a pattern inspired by a bee colony—a place where no bee commands, yet all are coordinated. None are in a hurry, yet none remain still. Movement is continuous and optimized, not competitive and tense.

Within this network, each vehicle functions like an intelligent cell; information about routes, times, energy,

loads, city needs, and environmental conditions is exchanged instantaneously among all. A central artificial intelligence does not issue commands or punishments; rather, it functions like a collective mind, extracting the best decisions for the entire system.

The result is astonishing:

No need for signs. No need for traffic lights. No need for intersections.

What seemed impossible in modern cities became the most obvious principle in **Niyaee**. With cars removed from the city surface, the concept of “urban accident” practically vanished. Children move without fear, the elderly stroll with tranquility, and families are no longer worried about the sudden passage of a car. Security is provided not through police surveillance, but through intelligent design.

In **Niyaee**, the city adapts to humanity, rather than forcing humanity to adapt to it. Time is no longer an enemy. Movement is no longer stressful. And transit is no longer synonymous with anxiety.

The city’s economy has also benefited from this transformation. Costs associated with fuel, accidents,

repairs, insurance, medical treatment, and heavy urban infrastructure have been dramatically reduced. Clean energy is distributed optimally, rather than consumed wastefully. And the city's primary asset—healthy, calm, and creative human beings—has the opportunity to flourish.

The **Planetary** vision of **Niyaee** demonstrated that the problem of modern cities was not a lack of technology; the problem was a lack of the right philosophy in the design of transit.

When the car stepped away from the center of the city, humanity returned to the center. And this was the beginning of the story of a city that understood:

To move, one need not always run, and to progress, one need not always press the accelerator.

***

The nascent dawn hadn't fully established itself when "Arman" stepped onto the glass platform at the entrance to Niyaee. There was no blare of horns, no tremor of asphalt beneath his feet, no acrid scent of burnt gasoline that lingered in old cities like a bitter memory. Only the gentle rustling of wind through

bushes and flowers, and the silent glide of a solar-powered cable car passing overhead without haste, could be heard.

Arman murmured to himself, “It’s strange… a city, yet unlike any city I’ve known.”

Beside him stood “Leila,” one of Niyaee’s original inhabitants, having arrived years ago. She smiled, a smile that resembled assurance more than pride.

— “This isn’t a city in the way we’re accustomed to. This is the result of ending the war between humans and vehicles.”

Arman’s gaze swept across the cityscape. Children on intelligent bicycles glided along verdant paths. An elderly woman moved serenely on a wind scooter. A family drifted along a narrow canal between residential blocks in sleek boats. There were no lane markings, no traffic lights, no signs to be seen.

— “Then where is the order?”

Leila responded without pause, — “It resides within the city’s mind.”

They walked a few steps further. The path’s surface was

a blend of recycled wood and bio-materials; soft, silent, shock-free for knees and spine. Arman unconsciously slowed his pace. Something in the atmosphere compelled him to move more deliberately; as if the city was reclaiming haste from humanity.

Leila continued, — “In old cities, the streets were for vehicles, and humans were guests. Here, it’s the reverse. The city’s surface entirely belongs to humanity.”

— “And the vehicles?”

— “Beneath our feet.”

Leila pointed to the ground with the back of her hand.

— “Three subterranean layers. No intersections, no squares, no traffic lights. Vehicles move there like cells within a bee colony; not with human control, not with competition, but with coordination.”

Arman paused.

— “No signs? No laws?”

Leila laughed.

— “No signs, but not without laws. Here, laws aren’t

seen; they are calculated."

They entered a space that appeared to be a city square, but not a circle of asphalt, rather an open garden with narrow waterways. Children ran freely in the square—something unimaginable in old cities.

— "What if a vehicle makes a mistake here?"

— "It won't."

Leila stopped. Her voice was calm yet resolute.

— "Because it doesn't decide. It doesn't think. It doesn't compete. It simply executes."

Arman recalled a bustling intersection he had crossed every day for years; the horns, the sudden brakes, the arguments, the weary glances.

— "We always thought the problem was traffic…"

— "But the problem was the human behind the wheel." Leila finished her thought.

— "Fatigue, haste, fear, anger. We had entrusted those to the vehicles."

At that very moment, a translucent screen illuminated

on Leila's wrist. A live map of the city materialized, displaying luminous points moving with graceful fluidity.

— "These are the subsurface vehicles?"

— "Yes. Each point represents an autonomous, eco-friendly vehicle. Their energy is a combination of solar, wind, and bio-storage from the city itself."

— "So, traffic…?"

— "It simply doesn't exist."

Leila zoomed in on the map. The routes shifted continuously, like the pulsing veins of a living organism.

— "The algorithms are inspired by bee colonies. None of them follow a fixed path, yet all find the fastest and most efficient state."

Arman murmured, — "It's as if the city breathes."

— "Precisely. The city is a living organism, not a machine."

They paused beside a small station—no platform, no queue, just a shaded space with a few seats. Leila said,

— “If you wish to utilize the subsurface system, you simply select your destination. A vehicle arrives, you board, and upon disembarking, it proceeds to the next passenger.”

— “Ownership?”

— “Ownership is irrelevant. Access is what matters.”

Arman pondered. In old cities, a vehicle was a symbol of identity—model, color, price. Here, however, vehicles were unseen, and thus, there was no competition.

— “So, what do people showcase then?”

Leila paused thoughtfully.

— “Their health. Their free time. Their tranquility.”

A child ran past them, laughing, — “Mom! We’re running late, the school drone is departing!”

A small, silent drone glided overhead at a low altitude. Arman smiled.

— “Do children here not fear vehicles?”

— “Children here simply don’t *see* vehicles.”

A gentle breeze stirred, rustling the leaves. Nothing in this city shouted. Everything whispered.

Leila spoke softly, — “We thought that to progress, we had to move faster. Niyaee has proven that we must become wiser.”

Arman took a deep breath.

— “Perhaps, for the first time, the city gives us time, instead of taking it away.”

Leila smiled.

— “Welcome to a city where traffic exists only in memories.”

What unfolded in this section was not merely a description of a futuristic city or a technological fantasy, but a representation of a profound paradigm shift in the relationship between humanity, space, and technology. The Niyaee system, in this section, is not presented as a collection of streets and buildings, but as a “living and intelligent system”; a system built on the elimination of the historical conflict between humans and vehicles. In contemporary modern cities, the vehicle has gradually transformed from a tool of service to an agent of dominance; streets have been

expanded for its passage, squares designed for its circulation, and humans have been forced to adapt to its speed, danger, and stress. This process has resulted in traffic, pollution, chronic anxiety, wasted time, and psychological erosion of citizens.

Conversely, Niyaee creates the first and fundamental rupture from this inefficient pattern by removing the vehicle from the city surface. The city surface is entirely returned to humanity; to the natural movement of the body, to social interaction, to children's play, to pauses, conversations, and the experience of living. The absence of signs, traffic lights, and lane markings is not a sign of disorder, but the result of transferring order from "external and imposed tools" to "internal and intelligent systems." In this model, order no longer shouts, but calculates; it is not seen, but is always present.

An analysis of the conversations between Arman and Leila reveals that Niyaee has not eliminated vehicles, but rather returned them to their rightful place. The vehicle has been removed from social and symbolic life and transferred to a subsurface infrastructure layer, silent and anonymous. This shift in concept is profoundly important: in old cities, the vehicle carried

meaning, power, competition, and boasting; but in Niyaee, the vehicle is simply a “function,” not an “actor.” Decision-making, planning, and coordination have been taken from stressed-out humans and entrusted to artificial intelligence; an intelligence that does not tire, does not rush, is not angry, and does not experience perceptual errors.

The inspiration from bee colonies in the management of subsurface traffic reflects a transition from a competitive logic to a synergistic logic. Just as bees, without a central authoritarian leader or direct instructions, form the most complex patterns of movement and production, Niyaee’s self-driving vehicles also create a fluid and knot-free traffic network through data exchange, moment-to-moment prediction, and dynamic adaptation. The elimination of intersections, squares, and traffic lights is a direct consequence of this intelligence; because intersections are a product of human cognitive limitations, not an inherent necessity of movement.

At the surface level, replacing vehicles with intelligent bicycles, electric scooters and wind scooters, urban boats, and solar cable cars not only reduces pollution and increases physical health, but also leads to the

formation of a collective psychological tranquility. When movement becomes silent, smooth, and predictable, the human mind also escapes from a state of constant alert. Children growing up in Niyaee do not experience vehicles as a source of threat, and this very fact instills a fundamental sense of security in them from the earliest years of life.

The concept of “ownership” is redefined in the realm of transportation in Niyaee. In this city, ownership of a vehicle gives way to intelligent access. This change has far-reaching economic and social implications: reduced household costs, elimination of consumerist competition, reduced financial pressure, and ultimately, increased social equality. When vehicles are unseen, comparison disappears, and humans have the opportunity to define their identity not in objects, but in the quality of life.

Another key point is the change in the experience of time. In modern cities, traffic devours time and keeps humans in a state of constant acceleration. But in Niyaee, with the elimination of traffic and the predictability of transportation, time is returned to humans. This return of time forms the foundation for creativity, mental health, and deeper human

relationships. Niyaee, from this perspective, is not merely a transportation project, but a civilizational one that seeks to harmonize the rhythm of human life with nature and the human body.

Finally, the second part makes it clear that the superiority of the Niyaee system over contemporary modern cities lies not only in its advanced technology, but also in its “design philosophy”; a philosophy that places humanity at the center, nature as a partner, and technology as a servant. This city demonstrates that it is possible to build an efficient, dynamic, and wealth-generating city without horn blasts, without intersection anxiety, and without the constant fear of accidents. Niyaee is a city that has solved traffic not with wider streets, but with deeper wisdom.

***

Arman was still lost in thought when a calm, emotionless, and crystalline voice resonated in the space around him; not from a loudspeaker, not from a device, but as if emanating from the city itself.

— “Arman, should you desire, I can simplify your thought process.”

He paused, and Leila looked at him, her expression devoid of surprise.

— “Do not be afraid. This is the voice of Niyaee.”

Arman spoke softly, — “The central artificial intelligence?”

— “I prefer to be called the ‘Harmonizer.’”

The voice was neither cold nor warm; something between the two, like the sound of water flowing through the canals.

Arman took a deep breath.

— “So, you decide when and where we move?”

— “I do not decide. I observe patterns.”

Leila stepped forward, speaking simultaneously, — “Niyaee is not a thinking brain; it is the guardian of the city’s balance.”

They entered a translucent tunnel; not a dark underground space, but a bright area with walls made of bio-materials that filtered sunlight. Autonomous subsurface vehicles moved silently in a lower layer, like fish in a current.

Arman said, — “In the old city, people fight to survive every morning. Why is there no rush here?”

Niyaee responded, — “Because routes are predictable, and the need for competition has been eliminated.”

— “But life is always unpredictable.”

— “That is correct. That is why humans have been returned to the city surface; a place for experience, not control.”

Leila paused.

— “We separated transit from life. Commuting here is not a distraction to thought.”

Arman gestured towards the subsurface vehicles.

— “What if a thousand people simultaneously want the same destination?”

Niyaee paused briefly; a pause that resembled respect more than hesitation.

— “In a bee colony, aimless congestion never occurs. Flows are divided, not concentrated.”

A holographic image appeared: routes branching into

finer tributaries, converging again at the destination.

— “Without intersections?”

— “Intersections arise when decision-making is entrusted to humans.”

Arman laughed.

— “So, signs are also casualties of that weakness?”

— “Signs are reminders of forgetting; when the system doesn’t understand, it is forced to shout.”

They emerged from the tunnel. Again, the city surface; sunlight, water, flowers, and fragrance. A child on an intelligent bicycle stopped, without sudden braking, without fear.

Arman said, — “In my previous city, there was never a day without an accident.”

Niyaee responded, — “Because speed had outstripped reason.”

Leila added, — “Here, speed is a function of purpose, not excitement.”

Arman looked at the cable car gliding serenely between

the blocks.

— “All this system… what if it fails?”

— “I am not centralized.” The voice of Niyaee was calm.

— “Each section of the city can operate independently. Like a colony, not a single brain.”

— “So, the city won’t collapse?”

— “Cities collapse when they become overly reliant on control.”

Leila said, — “For years, we saw the city as a machine. Niyaee sees the city as an ecosystem.”

Arman paused.

— “And humanity?”

Niyaee responded, — “Humanity is neither a driver nor an obstacle; humanity is the reason for the city’s existence.”

At that moment, a small drone descended beside them, placing a lightweight package on a wooden platform before silently departing.

Leila smiled.

— “Daily shopping. Without traffic, without queues.”

Arman said, — “It’s as if the city is listening to people.”

— “No.” Niyaee corrected.

— “The city is learning.”

A breeze stirred. The waters of the canals rippled. No engine noise shattered the silence.

Arman quietly said, — “Perhaps we were mistaken to think that the city should fight *with* us.”

Leila responded, — “Or perhaps we had forgotten that the city could also be a collaborator.”

Niyaee concluded, — “In Niyaee, transit is not a problem; it is solved. What remains is life.”

Arman smiled. For the first time, he felt that the city was not driving him, nor pushing him, but accompanying him.

And this was just the beginning.

***

The crisis drill, a true serenity.

The alarm wasn't a siren. It wasn't even a bell.

Just a gentle shift in light, transitioning from green to amber, followed by Niyaee's voice, softer than ever:

— "This is a drill. Please continue with your normal activities."

Arman instinctively paused. In previous cities, even this single sentence would send his heart racing; a drill, a warning, a crisis—they were all synonymous with anxiety. But here, no one ran. No one shouted.

Leila said, — "It's a simulated earthquake. Level three."

— "What does level three mean?"

— "It means the city is prepared, and simply adjusts itself."

The ground beneath their feet didn't tremble, but deep within, the subsurface layers activated. Through the transparent sidewalk surface, Arman saw autonomous vehicles seamlessly altering their routes, not fleeing, but clearing space.

Niyaee explained, — “In traditional cities, a crisis means a simultaneous surge to the surface. Here, a crisis means distribution.”

— “Distribution of what?”

— “Energy, movement, attention.”

A live image materialized on the green wall beside them; not a monitor, but a reflection of light on the bio-surface. The subsurface routes shifted like a network of veins. No intersections locked, no squares became bottlenecks.

Arman said, — “Are you even predicting crisis traffic?”

— “I do not have traffic.”

Niyaee paused.

— “I have flows.”

A child playing by the canal, unaware of anything, mounted their wind scooter and glided away. Their mother didn’t reach out, didn’t call out. The path was safe; always.

Leila said, — “The biggest lie of old cities was

mistaking security for control."

— "And here?"

— "Here, security is the result of eliminating danger, not containing it."

In Arman's old city, an earthquake meant being trapped behind traffic, drivers who didn't know the way, signs that no longer made sense.

But here, emergency vehicles were already dispersed throughout the various layers, like guardian bees around a hive.

Niyaee continued, — "Our pattern is inspired by the bee colony. No bee waits for instructions; each knows its role."

— "And if one makes a mistake?"

— "The system does not rely on the individual."

Arman slowly exhaled.

— "So, removing the signs wasn't just for aesthetics."

— "Signs are a sign of the system's lack of understanding."

Leila said this with a smile.

— “When a city understands, it no longer needs to shout.”

The light returned to green. The drill was over.

— “Simulation terminated.” Niyaee’s voice was gentle.

— “No disruptions recorded.”

Arman looked around in disbelief.

— “That’s it?”

— “A crisis that stops life has a design failure.”

Niyaee added, — “Niyaee’s goal isn’t to make people heroes; it’s to ensure they don’t *need* to be.”

They reached the solar cable car platform. Cabins arrived and departed smoothly, without queues, without pressure. An elderly person with a cane entered one; the system automatically adjusted the weight, reduced the speed, without anyone pressing a button.

Arman said, — “In my city, the elderly were prisoners in their own homes.”

— “Because the city was built for vehicles, not for

humans.”

— “And here?”

— “Here, the vehicles are prisoners underground.”

Leila laughed.

— “And they’re quite happy, because they’re finally doing their job properly.”

The cabin moved. The city was visible from above, a living organism; blue waterways, gardens, the gentle movement of people. No horns, no stops.

Arman quietly said, — “Perhaps traffic wasn’t just about movement…”

Niyaee responded, — “Traffic is a congestion of incorrect decisions.”

A brief silence fell; a silence that was not empty, but full.

Leila gazed at the horizon.

— “The first chapter is just beginning to make sense, isn’t it?”

Arman nodded.

— “Yes. This city isn’t without vehicles…”

— “Then what is it?”

He smiled.

— “It’s a city that has returned humanity to the center.”

And Niyaee, without fanfare, continued its work; like a colony that knows survival lies in harmony, not speed.

A philosophical and aesthetic perspective on the car-free city.

The modern city, at a pivotal historical moment, committed a fundamental error; an error not born of malicious intent, but of an excessive simplification of the concept of progress. The automobile, initially introduced as a tool to facilitate human movement and expand horizons, gradually usurped humanity’s place within the city. Streets were no longer designed for encounters, conversations, and collective living, but transformed into conduits for vehicular passage. Squares became bottlenecks of anxiety, and intersections points where human time, energy, focus, and mental well-being were perpetually drained. The city, instead of being a haven for tranquility and flourishing, devolved into a perpetual stage of

competition, acceleration, and tension. It is here that the concept of traffic reveals itself not merely as a physical density of vehicles, but as a congestion of flawed decisions.

In the Niyaee city, the issue of the automobile is rethought from the root. This city is not formed through animosity towards technology, but through a deeper understanding of its rightful place. Technology in Niyaee is not eliminated, but rather relocated to its proper domain. The automobile, as a powerful, energy-intensive, and potentially hazardous tool, is no longer permitted to occupy the human living surface. The city surface is returned to humanity; to children who must move without fear, to the elderly who should not experience anxiety when crossing a street, and to families who have the right to experience the city not as an obstacle to life, but as an integral part of it.

The Niyaee city surface is a space that harmonizes with human movement. Intelligent bicycles, electric and wind scooters, pedestrian-centric pathways, boats in azure canals, and cable cars powered by solar and wind energy—these are not merely modes of transportation, but active elements of physical and psychological well-being. Movement in this city, instead of being a source

of stress, becomes part of the natural rhythm of life. The human body remains engaged in motion, yet is not exhausted; the mind remains active, yet is not agitated. This is the point where biology, psychology, and urban planning converge.

Conversely, the subsurface layers of the Niyaee city are designed to allow the automobile to perform its service function without disrupting human life. These layers are not mere imitations of conventional urban tunnels, nor hidden replicas of the same outdated logic. The Niyaee subsurface network lacks intersections, squares, traffic lights, and signs—not because of a lack of order, but because order has reached a level where it no longer requires warnings or directives. Automobile movement within this space is entirely autonomous and powered by clean energies. The automobile no longer decides, competes, rushes, or errs. Decision-making is entrusted to a system capable of processing millions of data points in an instant, one that is not susceptible to fatigue or emotion.

The artificial intelligence governing this system draws direct inspiration from natural structures; particularly, bee colonies. In a colony, there is no central commander controlling everything, yet harmony exists

at the highest possible level. Each bee acts with local information and its designated role, and collective behavior is the result of simple yet intelligent interactions. The Niyaee city is built on the same logic: distributed intelligence, decentralized decision-making, and continuous coordination. In such a system, traffic in its classic sense fundamentally does not arise, because congestion occurs when flows are forced to stop or intersect—precisely what has been eliminated in the Niyaee design.

The removal of signs and traffic signals is one of the most radical and profound differences between Niyaee and contemporary modern cities. A sign, at its core, is a sign of the system's lack of understanding; a testament to the fact that the city does not comprehend and is therefore compelled to control human behavior through directives. In Niyaee, understanding has replaced directives. The movement system perceives the situation and responds appropriately, without requiring humans to constantly decode signs and navigate tense decision-making processes. This not only enhances the technical efficiency of the city but also significantly reduces the cognitive load on citizens—a burden that is one of the primary causes of

mental fatigue in modern cities.

From an aesthetic perspective, the removal of automobiles from the city surface and the elimination of signs leads to a liberation of visual space. The city becomes visible again. Architecture, nature, human movement, and the rhythm of life replace a mass of metal, warning colors, and imposed signs. This beauty is not merely superficial; it is a beauty born of the harmony between function and meaning. Niyaee is beautiful because it works, and it works because it is aligned with the logic of nature.

Security in this city is not the product of stringent control, but the result of eliminating the source of danger. In contemporary cities, efforts to increase security often led to increased surveillance, cameras, regulations, and police presence—an approach that, while it may reduce some risks, also increases social anxiety. In Niyaee, security is designed structurally. When automobiles are absent from the city surface, the risk of accidents, noise pollution, sudden death, and constant threat is eliminated. Children can move independently, the elderly can venture out without fear, and families can be present in public spaces without worry. This security is a stable and intrinsic security,

not temporary and imposed.

From an economic perspective, a car-free city means eliminating one of the largest sources of waste. Traffic in modern cities carries a hidden but enormous cost: fuel that is burned, time that is lost, nerves that are frayed, and productivity that is diminished. Niyaee optimizes the flow of movement and eliminates unnecessary stops, returning time and energy to life. This freed time is devoted to creativity, human connection, education, health, and personal growth—assets that no physical infrastructure can replace.

The psychological impact of such a city is perhaps its most significant achievement. The modern human is chronically exposed to stress triggers: engine noise, horns, the risk of accidents, constant haste. Niyaee eliminates these triggers, creating a space where the mind can find peace. This peace is not synonymous with stagnation, but with balance—a condition necessary for thought, creativity, and healthy coexistence.

Ultimately, the Niyaee city demonstrates that the future of urban planning lies not in adding more technology, but in a deeper understanding of humanity and nature.

This city proves that it is possible to be advanced without sacrificing humans to speed, to be intelligent without complicating life, and to be modern without losing tranquility. Niyaee is not a city without automobiles; it is a city that has returned humanity to the center of its biological world—and, as such, is not merely an urban project, but a rethinking of civilization itself.

Chapter Two: The Niyaee Planetary city: An Ecosystem-Centric City

A city, before being a collection of buildings and streets, is a living organism; an entity that breathes, reacts, becomes ill, or heals. Contemporary modern cities, despite their apparent grandeur, have long exhibited signs of illness: air that is no longer clear, water that is no longer alive, soil that no longer carries the scent of life, and humans who no longer know why they are weary. Environmental pollution in these cities is not merely a consequence of fossil fuel consumption or vehicle density; it is the result of a flawed perspective on the relationship between humanity, technology, and nature. The Niyaee Planetary city begins from this very point: a redefinition of this relationship.

In Niyaee, the environment is not a “component” of the city, but its foundation. This city is designed upon a simple yet profound principle: if the city is not in harmony with the rhythm of nature, no amount of technology or management can ensure its sustainability. Therefore, the first fundamental decision in the design of Niyaee is the complete elimination of polluting sources from within the urban fabric. Not as

an environmental slogan, but as a biological necessity. Fossil fuel vehicles, polluting industries, and heavy traffic—all are removed from the human living zone and relocated outside the city; where they can be managed with precision, control, and clean technology.

The absence of fossil fuel vehicles in the Niyaee city signifies not merely a reduction in air pollution, but a transformation in the quality of life. In contemporary modern cities, even when vehicles are not moving, their presence is felt: the sound of the engine, the smell of fuel, the tremor of the earth, and the constant threat. In Niyaee, this mental presence is also eliminated. Citizens not only breathe clean air, but also possess lighter minds. The silence of Niyaee is not a dead silence; it is a living silence in which the sounds of water, wind, human movement, and life are heard.

Industries and production centers, which in modern cities often grow haphazardly alongside residential areas, occupy a distinctly different position in Niyaee. These centers are established as specialized clusters outside the city and powered by intelligent networks of clean energy. Solar, wind, geothermal, and electrical energy are designed as primary sources, not as alternative options. This approach ensures that even at

the scale of production, the carbon footprint is minimized, and the production and consumption cycle operates in harmony with the Earth's natural capacities.

This model, devoid of heavy-duty vehicle traffic within the city, creates a multi-layered advantage. First, the urban structure is freed from constant physical pressure; streets, buildings, and infrastructure do not deteriorate. Second, noise and vibration pollution are reduced to near zero—a factor that directly impacts neurological and sleep disturbances among citizens in contemporary cities. Third, public safety is fundamentally enhanced, as one of the most dangerous elements of the urban environment—heavy vehicles—is completely removed from the human living space.

But perhaps the most crucial environmental element of the Niyaee city is its extensive network of waterways. Water in this city is not merely a consumable resource; it is an active element in urban design. The canals not only provide the possibility of boat navigation, further reducing the need for vehicles, but also play a key role in moderating the urban climate. The constant flow of water balances the ambient temperature, maintains a healthy level of humidity, and prevents the formation of heat islands—one of the primary challenges facing

modern cities. In contemporary cities, water is often either hidden or contained; in pipes, underground channels, or behind dams. In Niyaee, water returns to the city surface, but not as a threat, but as a biological partner. Boats are part of daily life, not a tourist attraction. Movement on water slows the rhythm of life and transforms the human relationship with space. The Niyaee citizen experiences the city not only from the ground level, but also from the water—an experience that inherently strengthens the sense of belonging and care for the environment.

Green space in Niyaee also follows a different logic. Contrary to popular belief, tall trees are not planted within the city. This decision is not born of indifference to nature, but from a safety-conscious and realistic perspective. During storms, earthquakes, and natural disasters, tall trees within a dense urban fabric can become a source of danger. Instead, Niyaee utilizes low-lying ground cover, resilient plants, linear gardens, and controlled green spaces within the city, relocating dense forests and tree groves to the outer belts of the city.

This intelligent segregation is an advantage rarely seen in contemporary cities. Cities where industry, housing,

transportation, green space, and services have grown haphazardly today face a range of environmental, safety, and psychological crises. Niyaee demonstrates that the problem is not a lack of resources, but a lack of natural order in design. When each element is placed in its rightful place, the city not only avoids pollution but becomes a purifying system itself.

The air of the Niyaee city is the product of this harmony. Air that is purified not with artificial filters, but with thoughtful design. Wind flow, water humidity, external vegetation cover, and the elimination of polluting sources all combine to create a climate that makes breathing a conscious experience, not an unconscious habit. The Niyaee citizen values the air, because they feel it—clear, cool, and alive.

In such a city, the environment is no longer a subject for campaigns and slogans. The environment becomes part of the collective ethics. The Niyaee citizen knows that every action, every consumption, and every decision resonates within a living system. This awareness is formed not through coercion, but through daily experience. When the city respects humanity, humanity respects the city. This reciprocal relationship is what contemporary cities are striving to rebuild, but

Niyaee has embedded it from the outset.

***

The water flowed gently, without haste. The solar boat glided smoothly across the canal, and the reflection of light on the surface transformed the white walls of the city into a living shimmer. Sara dipped her hand into the water and said,

— “It’s remarkable… it has no scent. Not like the rivers of old cities, nor like concrete canals.”

Arman smiled.

— “Because here, the water doesn’t just pass through; it lives.”

The boat passed alongside a platform where several children were seated. One of them splashed their feet in the water, laughing. There was no engine noise, no horn, no shout—only movement.

Sara said, — “You know, in the previous city, whenever the topic of the environment arose, everything shifted towards slogans. Recycling waste, reducing consumption, less plastic… but the city itself never changed.”

Arman gestured towards the canal.

— “Because the problem wasn’t individual behavior. The problem was the structure. Here, the structure is such that you can’t even *try* to harm the environment.”

The boat gently docked at a stop. An elderly man in simple clothes and a transparent tablet boarded. He looked at them and said,

— “Is this your first time in Niyaee?”

Sara nodded.

— “It is. And frankly… I’m still trying to believe it.”

The old man chuckled.

— “Everyone says that. I came here from a megacity a year ago. Half of these canals didn’t even exist back then.”

Arman asked, — “So, how did this ecosystem-based system come to be?”

The old man paused for a moment.

— “With a simple question: why should we purify the air when we can simply not pollute it?”

The boat resumed its journey. Along the canal bank, short flowerbeds, native plants, and pedestrian paths were visible. There were no tall trees, but the city felt verdant.

Sara said, — “It’s strange to me that there aren’t tall trees in the city.”

The old man responded, — “It was strange to us at first too. But then we realized that security means prevention, not reaction. A tree doesn’t ask who is beneath it during a storm.”

Arman added, — “But have you seen the green belts outside the city?”

Sara nodded.

— “From above, when we came in on the solar cable car… it was as if the city was breathing within a living ring.”

The old man said, — “Precisely. The trees are freer there, healthier, and protect the city like a natural filter.”

The boat entered a wider section of the canal. Several small cargo boats were moving silently. Sara asked,

— “Are these carrying cargo? Within the city?”

Arman said, — “Light cargo, yes. Without trucks, without fumes.”

The old man added, — “Heavy cargo never enters the city. Everything comes from outside, from clean production centers—and with intelligent scheduling.”

Sara paused.

— “So, all those factories that used to be nestled in the middle of neighborhoods in old cities…”

The old man interrupted, — “A historical mistake. Industry has its place, and life has its place.”

The boat passed alongside an educational platform. Several teenagers were discussing water flow around a holographic screen. One of them said,

— “If the flow rate increases, evaporation also increases.”

Another replied, — “That’s why the artificial intelligence regulates the water flow based on temperature.”

Sara murmured, — “Here, children don’t *conserve* the

environment… they *understand* it."

Arman smiled.

— "Because they experience it every day."

The boat approached the station. The wind whispered through the canals, but not in a disturbing way. The old man disembarked and said,

— "Remember, Niyaee isn't a clean city… it's a well-designed city."

Sara asked, — "Do you think other cities could become like this?"

The old man paused.

— "If they are willing to let go of some habits, yes. The hardest pollution is mental pollution."

The boat departed. Sara looked around; at the water, the paths, the people moving peacefully.

— "Here, it's as if the earth has had a chance to breathe."

Arman said, — "And when the earth breathes, humanity breathes too."

The sunlight fractured on the water, and the city continued, without a sound. The water was calm, but not still; just as the Niyaee Planetary city was calm, but not stagnant.

The solar boat moved through the central canal, and the reflection of light transformed the bright rooftops of the city into a gentle wave of life. In a silence that was not empty, but conscious, Leila held the hand of her five-year-old son, Nima. Nima asked,

— “Mom, why doesn’t this place have any sounds?”

Leila paused. The question was simple, but the answer required philosophy.

— “Because there’s nothing here that needs to shout, dear.”

Arman, who was sitting beside them, said,

— “In old cities, the air was always protesting. Smoke, noise, tremors… all signs of a constant conflict between humanity and the environment.”

Leila gazed at the water.

— “Here, it’s as if the environment is speaking to humanity, not with shouts, but with whispers.”

On the boat opposite, a middle-aged man with receding hair sat. His name was Yunes; one of the original architects of Niyaee's environmental systems. He said softly,

— "We learned that if we design the city like a living organism, we no longer need to fight against nature."

Nima leaned against his mother's shoulder.

— "Mom… why aren't there any trees here?"

Leila looked at Yunes. Yunes said,

— "It was strange to us at first too. But then we realized that security is part of the environment. It's about prevention, not reaction."

Arman added,

— "But have you seen the green belts outside the city?"

Sara nodded.

— "From above, when we came in on the solar cable car… it was as if the city was breathing within a living ring."

Yunes said,

— “Precisely. The trees are freer there, healthier, and protect the city like a natural filter.”

The boat entered a more expansive section of the canal. Several families with small personal boats were passing by.

Sara murmured, — “So, the environment isn’t being preserved here… the environment is being managed.”

Yunes nodded.

— “And more importantly, it’s being understood. Environmental ethics don’t come from compulsion, but from understanding.”

Nima squeezed his mother’s hand.

— “Mom, I’m sleepy here.”

Leila’s eyes welled up.

— “Because your body is no longer in a defensive state.”

Arman quietly said,

— “A good city is a calm city. And a calm city makes healthy humans.”

The boat docked. There was no smoke, no noise, no haste—only meaningful movement.

Yunes said before disembarking,

— “Niyaee isn’t perfect. No city is perfect. But we decided not to repeat our mistakes.”

Sara asked,

— “What if other cities don’t want to change?”

Yunes paused.

— “They will be forced to. The Earth is patient, but not infinitely so.”

The boat departed. Sara looked around; at the water, the paths, the people moving peacefully.

— “Here, it’s as if the earth has had a chance to breathe.”

Arman said,

— “And when the earth breathes, humanity breathes too.”

A Philosophical and Aesthetic Perspective on an Ecosystem-Centric City

The Niyaee city, from the very moment breath is drawn within it, presents itself not as a human construct, but as a living system; an entity that breathes, reacts, becomes ill, or heals. The environment within this system is not a "subject to be protected," but the "bedrock of life." In this city, the elimination of fossil fuel-based vehicles is not merely a technical decision, but a philosophical choice rooted in a redefinition of the relationship between humanity and nature. In Niyaee, humanity is not a consumer of the environment, but a part of its cycle, and this shift in perspective shapes the foundation of all urban design decisions. When there are no polluting vehicles on the city surface, the air no longer requires artificial purification; it is simply not polluted. This simple yet fundamental principle distinguishes the Niyaee city from the logic of contemporary modern cities, which are based on "pollution and then remediation."

The absence of heavy industries and mass production facilities within the city is a decision born from a deep understanding of both the human psyche and the ecology of the Earth. Modern cities, by intermingling

human habitation and industrial production, have blurred natural boundaries, resulting in increased physical illnesses, psychological erosion, and a disconnection between humanity and its surroundings. Niyaee does not repeat this error. Industrial centers are located outside the urban living zone; where they have direct access to clean energy networks and, through intelligent systems, their production is regulated by actual needs, not by an endless consumerist logic. Solar, wind, geothermal, and electrical energy in this structure are not “alternative options,” but the backbone of the city’s economy and urban life.

The waterways in Niyaee are not merely transportation routes; they are the lungs of the city. Water, in motion, moderates temperature, creates a balanced humidity level, and forms a microclimate that minimizes the need for energy-intensive heating and cooling systems. These canals simultaneously serve aesthetic, functional, and psychological roles. The constant flow of water slows the rhythm of life and makes it more human; freeing the mind from the acceleration imposed by modern cities and returning the body to a natural rhythm. In such a space, movement by boat is not a luxury choice, but the most natural form of

transportation; a form that automatically negates the need for a vehicle.

In Niyaee, green space is redefined. The absence of tall trees within the city, contrary to popular belief, is not a sign of disregard for nature, but the result of prioritizing safety, prevention, and sustainability. Modern cities often create a conflict between apparent aesthetic beauty and citizen safety, and then pay the price of this conflict in the form of natural disasters. Niyaee does not accept this dichotomy. Gardens and tree groves are located in the periphery of the city, forming a living and intelligent belt that not only purifies the air but also provides a natural habitat and protects the city from natural hazards. This conscious segregation is an example of the same rationality rarely seen in contemporary cities.

From a philosophical perspective, the Niyaee city is built on the principle that humanity is not the “owner” of the Earth, but its “trustee.” When this principle informs urban design, the result is a city where natural resources are not extracted or exploited, but managed. The environment in Niyaee is not a casualty of development; it *is* development. This city demonstrates that human well-being and the health of the Earth are

not only not in conflict, but are mutually dependent. Niyaee is an answer to the fundamental question of whether it is possible to progress without degrading the Earth; and its answer is not found in slogans, but in structure.

In comparison to contemporary modern cities grappling with pollution crises, urban heat islands, resource scarcity, and the psychological erosion of their inhabitants, Niyaee is a model of a city that has anticipated the crisis. Instead of treating symptoms, this city addresses the roots, demonstrating that the future of urban living lies not in more technology, but in deeper wisdom; a wisdom that sees humanity, nature, and technology as an interconnected system, not in competition with one another.

In the Niyaee city, the concept of pollution is not viewed as a "problem," but as a sign of flawed design. In modern cities, pollution is an inevitability; something to be managed with filters, masks, car-sharing schemes, and emergency warnings. But Niyaee rejects this logic from the outset. If something requires constant control, it shouldn't exist in the first place. This simple, yet profound, principle eliminates the need for many of the infrastructures that cost billions

in today's cities—not because of a lack of technology, but because of a maturity of thought.

The air of the Niyaee city is not a product of chance; it is the result of conscious design. The absence of fossil fuel vehicles, the elimination of heavy vehicle traffic, the precise separation of industrial and residential uses, and the use of active water networks all combine to create a system that naturally purifies the air. In this city, wind flow is directed, not blocked. The form of buildings is such that it strengthens air movement and prevents the formation of heat islands. Walls, roofs, and urban surfaces harmonize with nature, rather than absorbing and reflecting heat. The result is a stable climate that allows the human body to return to balance, rather than constantly resisting.

The waterways, which flow like living veins throughout the city, are not only designed for transportation or aesthetics. They are part of the city's temperature regulation system; a system that dynamically adapts to seasonal and climatic changes. Water in motion breaks the memory of heat, settles dust, and regulates the rhythm of the city's breath. Alongside these canals, a silence is heard that is rare in modern cities; a silence that is not empty, but the result

of the absence of sonic violence. This silence itself is a form of health.

The segregation of internal and external green spaces in Niyaee is the result of a deep understanding of the concept of "preventive safety." In contemporary cities, tall trees are planted within dense urban fabrics and then, during storms, earthquakes, or soil erosion, become a source of danger. Niyaee does not accept this contradiction. Within the city, short, flexible, and safe green spaces are designed; spaces that do not obstruct views, do not become havens for crime, and do not pose a threat in crises. In contrast, the green belts outside the city, with dense tree groves, artificial forests, and expansive gardens, perform the role of the city's lungs; without endangering the biological safety of citizens.

From an aesthetic perspective, this segregation creates two complementary experiences: minimalist tranquility within the city and the grandeur of nature surrounding it. In Niyaee, humans learn not to impose nature on the city, nor to flee from it, but to establish a wise distance. This distance is neither separation nor dominance; it is mutual respect. This approach, unlike cities that either decorate or consume nature, establishes an ethical relationship between humanity

and the Earth. At a deeper philosophical level, the Niyaee city demonstrates that the environment is not merely a technical issue, but an existential one. When humanity sees itself as the owner of the Earth, destruction is justified; but when it sees itself as a steward, protection becomes an intrinsic duty. This shift in perspective permeates politics, economics, and architecture in Niyaee. Clean energy is not an alternative slogan, but the governing logic of production and consumption. No resource is extracted beyond need, because intelligent systems regulate consumption not based on desire, but on necessity.

In comparison to contemporary cities that are constantly "correcting past mistakes," Niyaee is a city built from the outset on the principles of foresight, prevention, and balance. This city demonstrates that a healthy environment is not the result of sacrifice, but of thoughtful design. Niyaee proves that it is possible to build a city where development is not the enemy of nature and where human well-being is not achieved at the expense of the Earth's degradation. In this system, the environment is not the periphery of urban life, but its essence; not a victim of progress, but its measure.

In the Niyaee city, ethics is not a collection of imposed

laws, but the result of living within a well-structured system. Humanity is ethical when the system around it does not constantly force it into conflict with its conscience. In modern cities, many unethical behaviors—from energy waste to environmental destruction—do not stem from individual malice, but from systemic compulsion. An individual knows that excessive consumption is wrong, but is forced to live in a system that offers no alternative. Niyaee breaks this cycle of unwanted guilt. This city allows people to experience “being good” without psychological cost.

From the perspective of environmental theology, Niyaee is built on the principle that the Earth is a trust, not a possession. This perspective sharply contrasts with the ownership-centric approach of contemporary cities; where land is subdivided, priced, and exploited to its fullest extent. In Niyaee, the Earth is regarded as a living entity with capacity, boundaries, and a need for rest. Architecture, energy, transportation, and even the rhythm of urban life are aligned with these capacities. Humanity in this system is not a ruler or a final consumer, but a temporary guardian of a larger cycle.

The theology of Niyaee is a silent and non-dogmatic one. In this city, the name of God is not written on

walls, but is manifested in the way water is consumed, in the respect for silence, in the avoidance of polluting the air, and in the spatial justice between generations. Niyaee demonstrates that faith can be transformed into structure, rather than a slogan. A structure that, even if its inhabitants are not religious, will unconsciously move in the direction of preserving creation. This is the point where ethics, theology, and urban design converge.

From an urban anthropological perspective, Niyaee is a response to the crisis of human alienation in the modern world. Today's cities have transformed humans into hurried, isolated, and constantly competitive units. Traffic, pollution, noise, and time pressure keep the human body and mind in a chronic defensive state. In such a situation, empathy diminishes, and society becomes a collection of lonely individuals. Niyaee, by eliminating the fundamental disruptive factors, makes it possible for humanity to return to its natural rhythm. When the body calms down, the mind has space to think, and ethics regain meaning.

In Niyaee, the city is not a stage for human conflict, but a field for coexistence. Public spaces are designed to facilitate human interaction, not to accelerate passage.

People see each other, hear each other, and feel each other's presence. This presence forms the basis of social trust; an element that is severely lacking in modern cities. Trust, in turn, is the foundation of collective ethics, and without it, no law or regulation will be sustainable.

From a philosophical standpoint, Niyaee is based on the premise that "a good life" precedes "rapid development." This city re-poses a fundamental question: For what and for whom is progress? If the result of progress is the degradation of the body, mind, and Earth, can it still be called progress? Niyaee demonstrates that it is possible to progress without degrading the Earth; and its answer is not found in slogans, but in structure.

In conclusion, the Niyaee city is an attempt to reconcile the three facets that have become disconnected in the modern world: humanity, nature, and meaning. The environment in this city is not an external issue, but a mirror of the human inner state. The more honest and responsible humanity's relationship with itself, the more healed its relationship with the Earth becomes. Niyaee makes this connection possible, not through preaching, but through making it livable. This city

demonstrates that the future of urban living is not in more technology, but in deeper wisdom; a wisdom that sees humanity, nature, and technology as an interconnected system, not in competition with one another.

Chapter Three: The Niyaee Planetary City: The Five-Minute City

Time, in contemporary cities, has become a hidden enemy of humanity. Not because of its scarcity, but because of its theft. Modern humans possess more time-saving devices than ever before, yet experience "living time" less than any generation. Distances have stretched, routes have lengthened, and daily life has become a chain of exhausting transitions. It's as if the city, instead of being a container for life, has become an obstacle between humanity and living. In this world, the concept of the Niyaee five-minute city is not merely an urban planning idea, but a profound ontological redefinition of the relationship between humanity and time. In Niyaee, time is returned to humanity. Not through speed, but through proximity. A proximity that reduces not only physical distance, but also psychological, social, and ethical distance. The Niyaee five-minute city is based on the premise that if humans can meet their fundamental needs within a short and safe radius, their quality of life will be fundamentally transformed. This city does not ask, "How fast are you moving?" but rather, "How much do you need to move?"

Here, the city is no longer a network of streets, but a network of possibilities. Possibilities for encounters, for pauses, for belonging. The elimination of vehicles from the city surface is not merely the removal of a mode of transportation; it is the elimination of a logic. The logic of speed dominating meaning. In Niyaee, the human body is the design criterion, not the machine. The human stride, their breath, their field of vision, and their biological capacity form the basis of spatial organization. This shift in scale is an ethical shift; for the first time, the city adapts to humanity, rather than the other way around.

The Niyaee five-minute city, unlike many contemporary models, has emerged not through comparison, but through transcendence. This city has carefully studied fifteen-minute cities, not to replicate them, but to move beyond them. Fifteen-minute cities were a courageous attempt to restore the neighborhood as the primary unit of life, but they remained tethered to the logic of the automobile; a vehicle that, while used less frequently, still serves as the central point of spatial decision-making. Niyaee breaks this tether. Not through mandatory prohibition, but through complete dispensability. In Niyaee, not using a vehicle is not a

virtue; it is an obviousness. Because there is no reason to use one. When school, clinics, markets, recreational spaces, workplaces, and cultural centers are all within a five-minute radius, the vehicle becomes a superfluous object. This elimination has deeper consequences than simply reducing pollution. It eliminates the mobile class divide. In a city where everyone walks, no one is ahead of anyone else. Speed does not generate a class privilege.

From an urban anthropological perspective, the Niyaee five-minute city represents a return to the “familiar scale.” A scale where people recognize faces, distinguish sounds, and places hold memories. This is what has been lost in large cities: spatial memory. Niyaee, by intelligently shrinking access, does not shrink the city or limit amenities, but humanizes the experience of the city. The neighborhood once again becomes a scene of life, not just a place to sleep.

The water-centric nature of the Niyaee city deepens this experience. Canals are not only routes of movement, but also paths of contemplation. Boats, unlike vehicles, slow down movement and broaden vision. As they pass, humans remain in a state of seeing. This connection between movement and revelation

distinguishes the Niyaee city from Planetary fifteen-minute cities. The city is like a ship moving not towards a distant destination, but within the stillness of meaning.

From the perspective of ethical philosophy, the Niyaee five-minute city shifts ethics from the realm of recommendation to the realm of structure. There is no longer a need to teach citizens to consume less, pollute less, or connect more with others. The very structure of the city makes these behaviors possible and even inevitable. This is embedded ethics; an ethics that arises not from fear of law, but from the ease of living.

In this city, justice means equality in time. Everyone has equal access to services, not just in terms of distance, but in terms of quality. This temporal justice reduces the hidden divides of cities; divides that are often masked by the name of development. Niyaee demonstrates that development, if it leads to increased distance between humans and their needs, is anti-development.

And perhaps most importantly, the Niyaee five-minute city is a response to the crisis of meaning in urban life. This city reminds us that cities are built for “living,”

not for “passing through.” When humans are no longer forced to fight for every simple need, they can return to deeper questions: How to live? With whom to live? And for what to live?

In the Niyaee five-minute city, movement is no longer synonymous with escape from place, but a form of continuous return to the center of life. Every route, every short walk, every ride on a bicycle or scooter, is a re-reading of humanity’s relationship with the surrounding environment. The Niyaee human does not pass through the city to obtain bread, knowledge, healing, or leisure; they dissolve into the city. It is this dissolution that reduces anxiety, because anxiety is always born of distance: the distance between need and access, between wanting and achieving.

In contemporary cities, even in advanced fifteen-minute models, there is still a form of “spatial caution.” Citizens always anticipate that a route might be closed, traffic might form, or transportation might be disrupted. The mind is tired even before movement begins. But in Niyaee, this anticipatory anxiety has been eliminated. Routes are simple, predictable, and shock-free. This predictability is one of the deepest components of psychological security; a security that

arises not from the presence of police, but from the transparency of the spatial structure.

The concept of “five minutes” in Niyaee is not merely a number; it is a perceptual unit. This time is so short that the human mind does not register it as “effort.” Studies in environmental psychology show that distances less than five minutes are experienced by humans as an extension of their home space, not as a journey. This is why, in the Niyaee city, the neighborhood is not just an administrative area, but a complete living world. Children, the elderly, working individuals, and artists all live within a common temporal field.

In fifteen-minute cities, despite all progress, there is still a form of “planning for going.” Citizens must decide, schedule, and sometimes even choose the appropriate mode of transport. But Niyaee takes decision-making off humanity’s shoulders. The city is designed so that the right choices are the easy choices. This is where ethics is designed; not taught. The Niyaee five-minute city does not tell people to consume less; it renders excessive consumption meaningless.

From the perspective of technology philosophy, the

role of artificial intelligence in Niyaee is an invisible but fundamental one. This intelligence does not command or intervene directly; it adjusts the conditions. Algorithms, behind the scenes, analyze the distribution of services, the density of use, movement patterns, and collective needs to ensure that the city remains in balance. But this intelligence never replaces the human experience. Niyaee carefully avoids the danger that modern smart cities have fallen into: cold technocracy.

In Niyaee, artificial intelligence is inspired by bee colonies; a distributed, decentralized, and adaptable system. There is no central command authority. Each neighborhood, each service cluster, functions like a living cell that is both independent and interdependent. This pattern protects the city from fragility. If one part malfunctions, the entire system does not collapse; just as in a natural ecosystem.

The water-centric nature of the city completes this logic. The waterways are not only routes of movement, but also define the soft boundaries of neighborhoods. These boundaries are neither dividing nor confining; they are like rivers in a plain, guiding the flow of life. In fifteen-minute Planetary cities, the neighborhood

boundary is often contractual and administrative; but in Niyaee, boundaries are lived. Family life is transformed in this structure. A child no longer travels through the city to go to school; they glide from home to the neighborhood. Parents reclaim lost time between work and commuting. The elderly can be present in public spaces without fear of vehicle traffic. This presence of generations together is what modern cities have lost and try to compensate for with artificial "social interaction" programs.

From an urban economic perspective, the Niyaee five-minute city fosters a calm yet sustainable economy. Small businesses flourish within the fabric of the neighborhood, rather than competing with massive centers. The flow of money circulates within the city, rather than flowing out. This economy is less vulnerable and more humane. Unlike fifteen-minute cities, which remain susceptible to urban redevelopment and rising land prices, Niyaee, by eliminating vehicle-based ownership and employing intelligent land management, prevents the displacement of native residents.

The Niyaee five-minute city is a response to a deeper question: Can a city progress without haste? Niyaee

demonstrates that progress does not necessarily mean greater speed, but rather less waste—less waste of time, energy, nerves, and meaning.

***

Morning in the Niyaee five-minute city doesn't begin with sound; it begins with light. Light that slips from the surface of the canal waters onto the bright walls of the city, gently reaching the windows, not shattering sleep, but inviting it to awaken. The city has no horns, no haste, no warnings. The only sign of the day beginning is a shift in the quality of the air; a breeze that passes over the water, bringing the scent of salt and coastal plants.

Arman opens the window. Not to see traffic, not to check the time. He has no need to know the precise hour. In Niyaee, time is not measured in minutes, but in accessibility. His daughter's school is four minutes away. His workplace is a three-minute walk. The bakery, the library, the clinic, the recreational space, the cultural center—all are within that short radius; close enough that the human mind doesn't consider them "far."

His daughter, Raha, puts on her cycling shoes and asks,

“Dad, can I take the water route today?”

Arman smiles, — “Any route you like. The city knows the way.”

He doesn’t exaggerate. The city truly knows. The routes are intelligently designed, but not in a way that is visible. The Niyaee artificial intelligence functions like a hidden mind; it doesn’t command or issue directives. It simply maintains balance. If a crowd moves toward a route, other routes soften; the light, the sound, even the temperature of the air shifts slightly to disperse the flow. The city doesn’t speak to humans, but it communicates with them.

Raha mounts her bicycle. There are no vehicles on the city surface. There is no fear in the child’s gaze. This elimination of danger is the simplest and deepest gift Niyaee gives to future generations. In this city, children don’t learn “to be careful of cars,” but to “listen to the route.”

Arman sets off. His steps are not hurried. Why should they be? He isn’t late for anything. In old cities, humans are always lagging behind: behind time, behind schedules, behind life. But Niyaee has taken lagging behind from humanity. Arrival is not a goal; it’s a state.

On the way, he encounters Nazanin, a neighbor who walks alongside the canal each morning. She says, — “You know? I used to think walking was a waste of time.”

Arman replies, — “In the old cities, we used to squeeze walking between two rushes.”

They pause. Pausing in Niyaee is not meaningless. No one honks. No one is in a hurry. Silence is part of the city’s infrastructure. Nazanin continues, — “Here, it’s as if the city is waiting for us, not the other way around.”

At noon, the center of the neighborhood is vibrant, but not crowded. Like a bee colony, everyone knows where to be, without being told. The artificial intelligence, by analyzing daily patterns, adjusts the distribution of services. No queues form, no congestion occurs. Everything flows.

In a neighborhood café, a conversation is overheard between two elderly people:

— “Do you remember how half a day used to go by just to see a doctor?”

The other replies, — “Back then, the city was big, but

life was small.”

This sentence is the philosophy of Niyaee. The city has shrunk so that life can grow. In fifteen-minute cities, there is still a need for planning; there is still distance, there is still a vehicle. But in Niyaee, the vehicle has been removed from the surface, and with it, a large portion of mental anxiety.

In the afternoon, Raha returns from school. She is neither tired nor nervous. School is part of the neighborhood, not a separate institution. Education in Niyaee is an extension of life, not an interruption of it. Teachers say that children in this city have greater focus. Psychologists know why: the child’s brain is no longer exposed to danger, noise, and haste every day.

At sunset, the family sits beside the canal. Small boats glide by peacefully. Sunlight shatters on the water’s surface. The city breathes. Arman thinks to himself that here, no one plans to “escape the city.” The city is a destination, not an obstacle.

At night, when the lights dim to a minimum intensity, the city sinks into a deeper silence. A silence that is not frightening; it is safe. The Niyaee city is still watchful at night. Data, flows, energy—all in balance. But this

watchfulness doesn't feel like being observed; it feels like being released.

Before going to sleep, Arman says:

— "You know what the difference is between here and other places?"

Nazanin asks, — "What?"

— "Here, we don't arrive at life… we *are* in life."

And this may be the deepest definition of the Niyaee five-minute city: A city where humans don't run, don't fight, don't flee, but arrive— before they run.

A new morning, Arman stands by the window; his hands free, without a watch. Raha stands behind him, still half-asleep, but curious.

Raha softly asks, — "Dad… why doesn't it make a sound in the mornings here?"

Arman pauses, as if receiving the answer from the city itself:

— "Because there's nothing here to outrun."

Raha: — "But in the old city, we used to wake up to the

sound of horns."

Arman: — "There, sound was a tool for managing time. Here, time is governed by life."

Raha mounts her bicycle; light, unchained, carefree.

Raha: — "What if I'm late?"

Arman smiles, not with assurance, but with certainty:

— "Being late only makes sense when there's a distance. Your school is four minutes away; even if you stop and watch the water flow, you'll still be on time."

Raha departs; without haste, without anxiety.

Arman walks down the pedestrian path. Nazanin comes from the canal.

Nazanin: — "Still without a watch?"

Arman: — "I realized that watches are mostly made for cities that can't regulate themselves."

Nazanin pauses, looking at the water:

— "It's strange… I always felt like I was falling behind in the old cities; behind the schedule, behind others, even behind myself."

Arman: — “Because distances were long. Distance doesn’t just create physical separation; it creates psychological distance. When you walk too much, you fall behind yourself.”

Nazanin pauses, looking at the water: — “Here, there’s no distance… just a path.”

A boat glides peacefully along the canal; without a motor, without a sound.

Nazanin: — “Have you noticed that no one runs here?”

Arman: — “Because there’s nothing to chase.”

A small boat passes by. Nazanin: — “And why do we not need to plan here?”

Arman: — “Because the city has learned to distribute energy.”

Raha returns from school; neither tired nor bored. Arman: — “How was your day?”

Raha: — “Good. Today, our teacher said our city is a school itself.”

Nazanin: — “What does it teach?”

After a moment of thought, Raha replies: — “It teaches us not to be afraid… and not to hurry.”

Saman quietly adds: — “That’s when design becomes ethical; it’s not taught, it’s built in.”

At dusk, the family sits beside the canal. Sunlight shatters on the water’s surface.

Arman: — “You know what the fundamental difference is between here and other places?”

Nazanin asks: — “What?”

Arman: — “Here, we don’t arrive *at* life; we *are* in life.”

And this may be the deepest definition of the Niyaee five-minute city: A city where humans don’t run, don’t fight, don’t flee, but arrive— before they run.

A new morning, and Arman stands by the window; his hands free, without a watch. Raha stands behind him, still half-asleep, but curious.

Raha softly asks, — “Dad… why doesn’t it make a sound in the mornings here?”

Arman pauses for a moment, as if receiving the answer

from the city itself:

— “Because there’s nothing here to outrun. The city waits for people, not the other way around.”

Raha: — “But in the old city, we used to wake up to the sound of horns.”

Arman: — “There, sound was a tool for managing time. Here, time is governed by life.”

Raha mounts her bicycle; light, unchained, carefree.

Raha: — “What if I’m late?”

Arman smiles, not with assurance, but with certainty:

— “Being late only makes sense when there’s a distance. Your school is four minutes away; even if you stop and watch the water flow, you’ll still be on time.”

Raha departs; without haste, without anxiety.

Arman walks down the pedestrian path. Nazanin comes from the canal.

Nazanin: — “Still without a watch?”

Arman: — “I realized that watches are mostly made for cities that can’t regulate themselves.”

Nazanin: — “It’s strange… I always felt like I was falling behind in the old city; behind the schedule, behind others, even behind myself.”

Arman: — “Because distances were long. Distance doesn’t just create physical separation; it creates psychological distance. When you walk too much, you fall behind yourself.”

Nazanin pauses, looking at the water:

— “Here, there’s no distance… just a path.”

A boat glides peacefully along the canal; without a motor, without a sound.

Nazanin: — “Have you noticed that no one runs here?”

Arman: — “Because the city doesn’t demand anything from its people that requires them to run.”

At noon, the center of the neighborhood is vibrant; not crowded, not empty. Saman stands before a simple interface; not a screen full of charts, but a live image of flows.

Arman: — “Are you still talking to the city?”

Saman, without looking: — “No… I’m listening.”

Arman: — “To what? Data? Algorithms?”

Saman gently shakes his head: — “To the rhythm. Data is just language. The city is like an ecosystem; if you just command, you disrupt its balance.”

Arman: — “So, what’s all that artificial intelligence for?”

Saman: — “To eliminate dominance, not create it. Here, artificial intelligence isn’t a decision-maker; it’s a balancer, like a bee that shows the way to nectar, not rules.”

Nazanin: — “So, why doesn’t congestion ever happen?”

Saman: — “Because pressure isn’t concentrated. The city has learned to distribute energy. No point is an absolute center, no human a permanent periphery.”

In the afternoon, Raha returns; neither tired nor bored.

Arman: — “How was your day?”

Raha: — “Good. Today, our teacher said our city is a school itself.”

Nazanin: — “What does it teach?”

After a moment of thought, Raha replies: — “It teaches us not to be afraid… and not to hurry.”

Saman quietly adds: — “That’s when design becomes ethical; it’s not taught, it’s built in.”

At sunset, the family sits beside the canal. Sunlight shatters on the water’s surface.

Arman: — “You know what the fundamental difference is between here and fifteen-minute cities?”

Nazanin asks: — “What?”

Arman: — “There, ‘arrival’ is still a goal. Here, arrival is a prerequisite.”

Nazanin: — “And there, there’s still a vehicle.”

Saman: — “And as long as there’s a vehicle on the surface, the human mind remains in a state of alert. Here, the city has removed danger from the surface of life.”

Raha: — “So, why do some cities still have vehicles?”

Arman: — “Because they think speed means progress.”

Saman: — “And Niyaee has realized that progress

means reducing waste; waste of energy, waste of time, waste of peace."

Night. The lights dim to a minimum intensity. Silence, not as an absence of sound, but as the presence of balance.

Nazanin: — "I'm afraid this peace will become normal for us…"

Arman: — "If it does, then we won't be able to return to sick cities. That fear is healthy."

Raha, on the verge of sleep: — "Dad… what if we have to leave here someday?"

Arman pauses; not from doubt, but from the responsibility of answering: — "Then we'll have criteria. We'll know how a city should treat humans."

The city doesn't respond. But the flow of water remains steady. The wind finds its path. And distances, remain short.

In the Niyaee five-minute city, life is not a race; because arrival, is no longer a goal, but the condition for beginning to live.

***

What we see today in leading cities around the world is a conscious effort to return “life” to the human scale of the city; an effort that began in Europe and gradually spread to America, Australia, Asia, and even the Middle East. Cities like Paris, Copenhagen, and Stockholm have demonstrated that it is possible to redefine priorities, remove the automobile’s dominance, and once again transform the city into a space for living, interacting, and breathing. Paris, inspired by the ideas of Carlos Moreno, transformed neighborhoods into the beating heart of the city; a place where schools, shops, parks, healthcare, and work are located within a short distance of home, and streets are transformed from thoroughfares for vehicles into spaces for everyday life. Copenhagen, with its deep culture of cycling and sustainable transportation, proved that the right urban choices can simultaneously improve health, sustainability, and quality of life. In cities across Sweden and other parts of Europe, the same path was followed, focusing on pedestrianization, public spaces, and equitable access; a path that resulted in reduced dependence on cars and increased feelings of belonging to the neighborhood.

Across the Atlantic, cities like Portland and Cedar

Rapids sought to adapt this idea to the North American context. Portland launched a long-term program with the fifteen-minute neighborhood concept to ensure that the majority of citizens could meet their daily needs without a car. Redesigning streets, strengthening cultural and social spaces, and focusing on affordable housing demonstrated that human-centric urban planning is possible even within car-centric structures, albeit challenging and gradual. Cedar Rapids also linked this model to climate goals, viewing the fifteen-minute city as a tool for reducing carbon emissions and increasing social equity, prioritizing vulnerable neighborhoods for transformation. In Australia, Melbourne incorporated elements of fifteen and twenty-minute cities into its long-term plans with a phased and flexible approach to address population growth and prevent urban sprawl.

This global movement wasn't limited to the West. Countries like China, Singapore, the United Arab Emirates, and the Philippines have also recognized the importance of local access, sustainable transportation, and compact cities. However, for Iran, this idea is not entirely foreign. A look at historical cities like Isfahan, Yazd, or Tabriz reveals that centuries ago, without

modern naming conventions, they embodied the logic of the fifteen-minute city. Bakeries, mosques, marketplaces, bathhouses, and communal spaces were all located within a short distance of home, and daily life unfolded within that neighborhood scale. This history demonstrates that a neighborhood-centric culture is deeply rooted in Iran, and what is needed today is a smart reinterpretation of those patterns in a contemporary form.

However, experience worldwide has shown that fifteen-minute cities are not without challenges. Modern cities have been shaped over decades based on the logic of the automobile; horizontal expansion, dispersed services, marginalization, and weak pedestrian infrastructure have made equitable access difficult. Changing these structures requires investment, time, and broad social participation. Furthermore, misinterpretations have arisen; the model is sometimes mistakenly portrayed as anti-car or restrictive of freedom, while its goal is not to eliminate choices, but to add more humane options. Density has also been a constant topic of discussion; density, if unplanned, leads to congestion, but intelligent density can increase the efficiency, vibrancy, and sustainability

of a city. The risk of urban redevelopment and rising property values is also a serious challenge that, without supportive policies, can displace low-income residents from their neighborhoods.

It is within this context that the Niyaee five-minute Planetary city opens up a fresh perspective and goes beyond established patterns. This city is not merely a more compact version of the fifteen-minute city, but a fundamental redefinition of the concept of access and urban life. Relying on water-centricity and inspired by the logic of a ship, Niyaee has a systemic structure in which everything is carefully and intelligently arranged. Access to services is not within fifteen minutes, but within five minutes, and that too in a safe, car-free, and human-centered environment. In this city, the vehicle has no place on the surface of daily life, because there is simply no need for it. This natural elimination of the vehicle is Niyaee's greatest distinction from fifteen-minute cities; a distinction that results in the complete reduction of pollution, spatial tranquility, and the improvement of the physical and mental health of citizens.

The Niyaee five-minute Planetary city, leveraging smart technology and artificial intelligence, is designed

from the outset based on a precise analysis of needs and the rectification of shortcomings in previous planning models. The risks of urban redevelopment, structural limitations, congestion, unbalanced density, and even misleading media portrayals—all have been anticipated and addressed within this model. The systemic and water-centric nature of the city functions like a cohesive ship; each part has a specific role, and the performance of the whole depends on the coordination of its components. This feature is absent in fifteen-minute cities, and it is this that makes Niyaee a unique model for the future of urban planning.

The Niyaee five-minute city in Chabahar, Iran, is not a fleeting trend or merely an experimental endeavor; it is a genuine response to the environmental, social, and human crises facing contemporary cities. This city demonstrates that it is possible to achieve all life's needs without haste, without traffic, and without pollution. Just as traditional Iranian neighborhoods once provided such quality, it is now possible, relying on modern technologies, to revive that lost spirit. The Niyaee five-minute city is a reminder of this simple yet often-forgotten truth: the city should be built for humans, not for vehicles; and if we envision a greener,

healthier, and more equitable future, this path can be the beginning of a profound transformation in the way we live.

If we want to look at this model more deeply, we must understand the Niyaee five-minute city not just as an "urban planning model," but as a paradigm shift in our understanding of time, space, and daily life. In today's cities, time has become an enemy of humanity; hours lost in traffic, energy wasted in exhausting commutes, and connections gradually fading. Fifteen-minute cities were an important attempt to reconcile humanity with the city, but they still operate within old structures; structures that have not completely abandoned the car, the street, and long distances.

In contrast, the Niyaee five-minute city begins from a point further along. This city is designed from the outset based on "maximum accessibility in minimum time," not as a correction to an existing city, but as a complete and self-sufficient system. When we say five-minute access, we don't just mean shortening the distance; it means intelligent design that slows the rhythm of life, makes it more predictable, and more human. In such a city, free time regains meaning; time that can be devoted to family, creativity, social

interaction, and mental peace.

Another key point is the water-centric nature of the Niyaee city. Fifteen-minute cities are primarily based on a dry substrate and a network of streets, while Niyaee, inspired by the logic of a ship and coastal living, has a different spatial order. Just as in a ship, all vital spaces are quickly and seamlessly accessible, so too are functions organized systemically and continuously in the Niyaee city. This organization not only simplifies movement but also enhances feelings of safety, ease of orientation, and spatial cohesion. The citizen does not get lost in this space; the city is readable and understandable to them.

The elimination of vehicles on the surface is not the result of compulsion or restriction, but the natural consequence of good design. In a fifteen-minute city, the vehicle still remains an option, and that very presence unconsciously brings with it streets, noise, pollution, and danger. But in the Niyaee five-minute city, when everything is accessible, the vehicle loses its meaning. Walking, cycling, and soft urban movements become part of a lifestyle, and the human body re-harmonizes with the city. This harmony improves physical health and reduces the hidden stresses of

urban life. From a social perspective, Niyaee goes beyond simply providing access to services. The neighborhood in this city is not just a geographical area, but a living social unit. Public spaces, pedestrian routes, and urban pause points are designed to encourage chance encounters, conversations, and everyday interactions. This is what has been lost in modern cities and existed in traditional Iranian neighborhoods. Niyaee recreates this quality with a contemporary language and relying on technology.

Smart technology and artificial intelligence do not play a decorative role here; they are the backbone of urban decision-making. The city's digital twin enables continuous prediction, correction, and optimization. The city is tested in the world of data before it is built; the social, environmental, and functional consequences of every decision are assessed and then brought to reality. This is why the Niyaee five-minute city is immune to many of the common errors of fifteen-minute cities and has become a more sustainable and future-oriented model.

Ultimately, the Niyaee five-minute Planetary city represents a conscious return to a forgotten principle of urbanism: the city as a habitat for humans. Not a field

of competition for speed, not a mass of streets and vehicles, but a space for living, pausing, seeing, and being. This city demonstrates that the future does not necessarily have to be more complex and crowded; it can be simpler, closer, and more human, if we dare to rethink conventional patterns.

The Connection Between the Niyaee City and Eco-Theology

If we move beyond the technical and planning layers and delve into the deeper meaning of the Niyaee five-minute city, we arrive at a connection that has been rarely addressed in contemporary urban discourse: the connection between the city and eco-theology, and with the future of coastal humanity. Here, the city is no longer merely an engineering construct or an efficient system, but takes on the meaning of a “trustworthy habitat”; a place where humanity is not the absolute owner of nature, but a co-inhabitant and guardian of it.

In eco-theology, whether in Islamic tradition or in contemporary global interpretations, humanity is considered a steward and trustee of the Earth, not its absolute ruler. This perspective shifts the relationship between humanity and nature from one of dominance

to one of responsibility. The Niyaee five-minute city stands precisely at this point. The elimination of vehicles, the reduction of energy consumption, the respect for natural water and weather cycles, and the design in harmony with the coastal environment—all are signs of this shift in perspective. The city is no longer imposed upon nature, but shaped by its capacities; the same logic that was seen in traditional coastal settlements and historical ports, where architecture understood and harmonized with the wind, water, tides, and climate.

Water in the Niyaee city is not merely an aesthetic or recreational element; it carries meaning. In theology, water is the origin of life, a symbol of purity, continuity, and mercy. The water-centric city subconsciously reminds humans of their fundamental dependence on life. When a citizen encounters water, the coast, and the horizon every day, their relationship with nature is not an abstract one, but a lived and everyday experience. This constant exposure transforms environmental ethics from a slogan into a habit; humans are less likely to destroy what they live with every day.

The future of coastal humanity in such a city is a future based on adaptation, not confrontation. In today’s

world, where climate change, rising sea levels, and resource crises have turned coastlines into the front lines of survival, the Niyaee city offers a proactive response. This city, instead of building walls between humans and the sea, learns how to live with it; just as a ship engages in dialogue with the sea, not war. The systemic structure of the city is flexible, able to adapt to climatic changes and transform resilience into an inherent characteristic, not an emergency response.

Within this framework, the Niyaee five-minute city provides a foundation for redefining the "coastal human"; a human whose rhythm of life is in harmony with the rhythm of nature, not enslaved by artificial haste. The coastal human of the future is one who re-understands time: not linear time of constant consumption and production, but cyclical time of tides, light and shadow, work and pause. Five-minute access to services, in this sense, is not just a functional advantage; it's a liberation from the constant anxiety of time scarcity. Humans have the opportunity to reflect, and this reflection forms the ethical foundation of their relationship with the environment.

From the perspective of eco-theology, the Niyaee five-minute city can be an embodiment of a "just city"; a

justice that is not limited to the distribution of services, but is also found in the distribution of the opportunity to live healthily. When everyone, without a vehicle and without discrimination, has access to water, air, public spaces, and services, the city becomes an ethical space, not just a functional one. This is where urban planning approaches wisdom.

The Niyaee five-minute Planetary city is a proposal for a future where humans, nature, and technology are placed in a meaningful balance. Technology is not in service of dominance, but in service of better understanding and responsible decision-making. Nature is not a backdrop, but a partner in urban life. And the coastal human is not a restless consumer of space, but a conscious and caring resident of it. Such a city can be a model for a world gradually realizing that survival lies not in greater speed, but in proximity, respect, and coexistence.

A Philosophical and Aesthetic Perspective on the Five-Minute Niyaee City

The Niyaee five-minute city cannot be simply understood as an urban planning model or a technological response to contemporary crises; Niyaee, even before being a “city,” is a philosophical stance. A

stance against a long history of cities built on dominance, haste, and accumulation. From the moment of conception, Niyaee poses a fundamental question: Should the city compel humans to move, or should it provide the possibility of remaining?

From a philosophical perspective, modern cities are built on the logic of distance. Distance between home and work, distance between living and thinking, distance between humans and nature. These distances are not accidental, but ideological. Distance is a tool of power; the greater the distance, the more effective the control. Niyaee undermines this logic from within by shortening distances. The five-minute city is not merely facilitating access, but negating the philosophy of postponement; postponing life to a future that never arrives.

From an ontological perspective, Niyaee takes time out of its linear form. In this city, time is not a path for overtaking, but a platform for experience. The absence of haste, intersections, and constant warnings frees the human from a state of emergency. This liberation has a profound consequence: humans are no longer forced to constantly *become*; they can *be*. In this sense, Niyaee returns to philosophical traditions that preferred being

over becoming, without denying progress.

The aesthetics of Niyaee are the aesthetics of silence; not silence as an absence of sound, but as balance. In modern cities, beauty is often defined by exaggeration: height, light, speed, movement. Niyaee, conversely, finds beauty in subtraction. The elimination of vehicles from the city surface, the elimination of visual pollution, the elimination of imposed haste. These eliminations open up space for a minimalist yet profound beauty; a beauty that soothes the gaze rather than conquering it.

In Niyaee, form follows ethics. Architecture is designed not for display of power, but for the preservation of human dignity. The absence of towering buildings in the center, the absence of dominating streets, and the absence of squares that diminish the human scale, are indicative of a philosophy that sees humans not as a measure of the world, but as being on a scale with the world. This co-scaling creates an aesthetics of humility; a humility in which the city neither shouts nor hides itself.

The five-minute Niyaee city possesses a kind of temporal beauty. Its beauty lies in the fact that everything is on time. Not too early, not too late. This timeliness is a rare experience in a world that is either

always lagging behind or constantly running ahead of itself. Niyaee returns time to humanity, and this return itself is an aesthetic act. Time becomes beautiful when it becomes human.

From a phenomenological perspective, living in Niyaee means a change in the quality of perception. The human body is no longer in a defensive state. The absence of vehicles, the absence of sudden danger, and the absence of aggressive sounds shift perception from a state of alert to a state of contemplation. The city becomes a backdrop, rather than a stimulus. This backdrop enables thinking, pausing, and seeing. In such a space, even movement takes on a meditative quality.

Niyaee also represents an aesthetic critique of the concept of progress. Progress in this city is not defined by height and density, but by reducing waste. Waste of energy, waste of time, waste of attention. Attention is the primary capital in Niyaee. A city that does not steal human attention, but preserves it, is fundamentally beautiful. This beauty is not decorative, but ethical; for beauty that destroys attention is ultimately violent.

The Niyaee five-minute city is not a return, but a reimagining. A reimagining of the relationship between humans, space, time, body, and meaning. Niyaee

demonstrates that it is possible to build a city that not only functions, but also thinks; not only moves, but also calms; not only facilitates life, but makes it livable. In this sense, Niyaee is not a distant dream, but a philosophical possibility standing before us—a possibility for a city whose beauty comes from its ethics, and whose ethics come from a profound understanding of humanity's place in the world.

To connect the philosophical and aesthetic perspective of the "Niyaee five-minute city" with the thought of great thinkers worldwide, one can demonstrate that this idea is not a sudden invention, but a contemporary crystallization of deep layers of philosophical, ethical, theological, and anthropological thought.

If we return to Martin Heidegger, the Niyaee five-minute city can be understood as an attempt to liberate oneself from "inauthentic living"; the condition that Heidegger calls falling into everydayness and being absorbed by "the They" (Das Man). Modern cities, with their haste, traffic, packed schedules, and long distances, have transformed humans into beings thrown into time; individuals constantly arriving and never quite arriving. Niyaee, by eliminating imposed haste, provides the possibility of conscious stillness; that

“being-in-the-world” authentic state that Heidegger considered a condition for thinking. In this city, humans have once again the opportunity not merely to be users of space, but to be inhabitants of it.

Hannah Arendt, in her famous distinction between “work,” “building,” and “action,” considered the city to be the setting for the emergence of human action; action that is only possible in a safe and accessible public space. Car-centric cities have reduced public spaces to thoroughfares, reducing action to movement. The Niyaee five-minute city stands precisely at the point that Arendt defended: restoring the public sphere to humanity, a place where conversation, presence, and coexistence are possible. Proximity to services, the elimination of danger, and the human scale transform the city from a “space of transit” into a “space of emergence.”

From the perspective of Lewis Mumford, the history of the city has always been oscillating between two poles: the city as a machine, and the city as a living organism. Mumford criticized industrial and modern cities for their dominance of the logic of the machine; the logic of productivity, speed, and accumulation. The Niyaee city can be seen as the realization of Mumford’s dream:

a city that has rhythm, not speed; balance, not haste. In this city, technology (including artificial intelligence) is not a ruler, but a regulator of biological balance; the very thing Mumford considered a condition for the survival of urban civilization.

Jane Jacobs, emphasizing lively streets, mixed-use zoning, and the local scale, was among the first to demonstrate that urban vitality arises from proximity and the interweaving of daily life. The Niyaee five-minute city takes a step further: not only revitalizing the street, but also reducing the necessity of traversing it. Life no longer happens in transit; it flows within the neighborhood itself. This is the spirit of Jacobs's thought, freed from the constraint of the automobile.

If we look at Michel Foucault, the modern city can be seen as one of the most complex disciplinary devices; a network of schedules, distances, and surveillance. The Niyaee five-minute city, by eliminating temporal and spatial compulsions, creates a form of spatial resistance against disciplined living. In this city, the human body is less controlled and more heard. Freedom is not synonymous with lawlessness, but with the reduction of hidden compulsions; those compulsions that Foucault considered more dangerous

than overt ones. In the tradition of eco-theology, thinkers such as Thomas Berry and Leonardo Boff argued that the ecological crisis is, before being a technological crisis, a crisis of the meaning of humanity. Modern humanity has defined itself as being outside of nature. The Niyaee city, particularly with its water-centricity and coastal living, repairs this rupture. Humans once again live within the cycles of nature, not against them. The city is not an enemy of nature, but a continuation of it. This is precisely what eco-theology calls “the reweaving of humanity and Earth.”

From an aesthetic perspective, we can return to Immanuel Kant; where beauty is experienced as “purposiveness without purpose.” Niyaee is beautiful, not because it is useful, but because its usefulness does not impose itself. The city works, but it doesn’t shout that it works. This tranquility is the quality that Kant considered a condition for the experience of beauty: freedom from coercion of the mind.

And finally, if we look at the world from the perspective of Zygmunt Bauman, the Niyaee five-minute city is an attempt to create an “anchor” in a restless world. Bauman warned that modern life constantly keeps humans in a state of impermanence.

Niyaee, by providing the possibility of remaining, by shortening distances, and by reducing urgency, makes it possible to become rooted again; not a return to the past, but the construction of a new stability.

In conclusion, it can be said that the Niyaee five-minute city stands within a deep intellectual tradition; a tradition that, from Heidegger to Arendt, from Mumford to Jacobs, from eco-theology to ethics, all emphasize one point:

A good city is not one that moves humans faster; it is one that brings humans closer to their humanity.

Chapter Four: The Niyaee Planetary city: A Water-Centric City

What fundamentally distinguishes the Niyaee Planetary city from all previously known human cities from its very inception is not merely “proximity to water,” but the transformation of water into the foundational logic of urban organization. In Niyaee, water is not a decorative, marginal, or recreational element; water is the city’s language. Just as in ancient maritime civilizations, the sea was not a border but a path, not a threat but an opportunity, in Niyaee, water does not limit the city; it defines it. This city begins with water, breathes with water, and thinks through water.

In contemporary modern cities, water is often a problem: scarcity, flooding, pollution, crisis. Water is either controlled or rejected; either imprisoned behind dams or rapidly discharged in concrete canals. This perspective stems from a mindset that sees nature as an obstacle to human order. Niyaee stands precisely at the opposite of this perspective. In this city, water is not something to be controlled, but something to coexist with intelligently. The city, instead of fighting with water, learns from its logic: flow, balance, flexibility,

and distribution. The water-centric nature of Niyaee directly leads to the adoption of a “systemic” form, inspired by the ship. The ship is the most complete metaphor for human habitation on water; a structure that must simultaneously be stable, self-sufficient, flexible, and safe. The Niyaee city functions like a vast but layered ship: each part has a specific function, each route is purposeful, and no movement is accidental. Just as in a ship, cargo, passengers, energy, and waste each have their own path and layer, so too in Niyaee, traffic, transportation, and daily life flow in separate but coordinated layers.

In this model, the sea is not only the gateway to the city, but also its economic backbone. All goods and cargo enter the city’s first systemic ring through water; where docks and wharves are designed not as harsh and industrial spaces, but as intelligent borders between the city and the outside world. This ring functions as a filter: purifying, organizing, and distributing. Once unloaded, cargo never enters the city surface. Citizens do not see trucks, do not hear loading sounds, and are not confronted with the burden of logistics. What remains is the tranquility of the city surface and the efficiency of the infrastructure.

Autonomous underwater vehicles, operating with clean energy and managed by artificial intelligence, continue the same logic as the ship: precise movement, without intersections, without accidents, without the need for signs, and without human error. In this sense, the Niyaee city is the first to completely separate logistics from the lived experience; without sacrificing efficiency. This separation is one of the deepest philosophical differences between Niyaee and modern cities; cities in which humans are inevitably forced to pay the price of system inefficiencies with anxiety, pollution, and danger.

But the water-centric nature of Niyaee is not limited to transportation and trade. Water in this city is a climate regulator. The network of water channels that flow throughout the urban system performs the same role as veins in a living organism. These channels naturally distribute humidity, moderate temperature, and steadily improve air quality. In a world where cities grapple with heat islands and chronic dryness, Niyaee demonstrates that urban climate can be the result of intelligent design, not costly mechanical intervention. The abundance of water fundamentally eliminates the issue of water scarcity. Drinking water, industrial

water, agricultural water, and water needed for horticulture and animal husbandry are all defined within an integrated and sustainable system. In Niyaee, water is not a resource for competition and crisis; it is a foundation for long-term planning. This water security has profound social and psychological consequences: a society that is not worried about survival can focus on flourishing.

From an economic perspective, the water-centric Niyaee city fosters a dynamic environment for ocean-based economies. Fisheries, aquaculture, marine biotechnology, blue tourism, and maritime trade are not on the periphery, but at the heart of the urban economy. This economy, unlike conventional urban heavy industries, is quiet, low-polluting, and sustainable. Wealth in Niyaee is not generated from destruction, but from coexisting with the marine ecosystem.

From an aesthetic perspective, water bestows a poetic quality upon the city that is difficult to achieve in land-locked cities. The movement of boats in the canals, the reflection of light on the water's surface, the daily and seasonal changes in color and texture of the city, all create a living and dynamic experience of space. Tourism in Niyaee is based not on congestion, but on a

calm and meaningful experience; an experience that does not consume the city, but understands it.

The Niyaee Planetary city, with its water-centricity, offers a fundamental proposal for the future of urban living: a future in which the city is neither an enemy of nature nor a victim of it, but an intelligent continuation of natural logic on a human scale. Niyaee demonstrates that if we consider the city like a large ship—a ship where all inhabitants are passengers on a shared journey—then its design, management, and living become imbued with a new meaning; a meaning in which sustainability, tranquility, security, and flourishing are not slogans, but the natural result of wise choices.

Once the Niyaee Planetary city established its logic upon water, no urban element held meaning independent of the sea. Streets were no longer merely routes; they were extensions of flow. The economy was no longer simply production; it was circulation. And life was no longer a competition for survival, but a participation in balance. In modern cities, land has always been the primary element, and water the periphery. Rivers are enclosed, coastlines privatized, and the sea pushed behind the city. This rejection of

water has gradually led to the rejection of flexibility, gentleness, and natural time. Niyaee, however, from the very beginning, inverted this relationship. The city is not built on imposed land, but on the logic of buoyancy; even where structures are fixed, thought remains afloat.

In Niyaee, maritime transit is not a luxury option, but a part of everyday systems. Boats fulfill the role that streets do in conventional cities; with the fundamental difference that boats do not shatter silence, occupy space, or create urgency. Movement on water inherently slows down and refines the human experience. This slowness is not a sign of backwardness, but an indicator of civilizational maturity.

The water-centric economy of Niyaee is decentralized, rather than concentrated. Docks are not bottlenecks, but breathing rings. Cargo is purified upon its first contact with the city: not only physically, but also meaningfully. Everything that enters the city must be compatible with its environmental, ethical, and functional logic. This city tolerates nothing that disrupts its rhythm.

From a social perspective, water transforms human relationships. Beside the water, boundaries soften. People build horizons rather than walls. Conversations become longer, and silence gains meaning. Niyaee, with water, guides humanity from ownership to participation; because water cannot be possessed, only lived with.

In the environmental dimension, Niyaee demonstrates that urban resilience is not achieved through rigid structures, but through flexible systems. The city, like a vast ship, is prepared for climatic changes: rising sea levels, temperature fluctuations, or biological variations—all anticipated in the design. Niyaee does not predict crises; it harmonizes with them.

And finally, the water-centric Niyaee city reminds humanity that civilization is sustainable only when it does not distance itself from its source of life. A civilization that forgets water will, sooner or later, forget itself.

***

The water was calm. Not still, not hurried.

Arman sat on a wooden platform; his feet submerged

in the water. Saman stood beside him, and Nazanin looked out at the horizon a little further back. Raha sat on the deck of an educational boat, touching the water's surface with her hand.

Raha: — "Dad… why doesn't our city have streets?"

Arman smiled. — "It does… it's just not called streets."

Saman said: — "It's called a flow."

Nazanin added softly: — "And a flow is something you can't stop… you can only harmonize with it."

Raha tilted her head: — "What if the water rises?"

Saman knelt beside her: — "Then the city breathes, not suffocates."

Arman: — "Most cities fight with water. Niyaee speaks with water."

Nazanin pointed to the distance, where the first-ring dock was visible. — "Do you know why the docks are outside the city?"

Raha: — "So the city doesn't get crowded?"

Nazanin: — "Because the city shouldn't get tired."

Saman continued: — “In modern cities, cargo, noise, smoke, and anxiety enter people’s lives directly. Here, cargo first disembarks from the water… then passes underground… and only then arrives at life.”

Arman: — “Like food. It must first be digested, then converted into energy.”

Raha: — “So our city has a stomach?”

Saman chuckled: — “Yes… and it’s very sensitive.”

Nazanin: — “That’s why nothing incompatible enters it.”

A gentle breeze blew. A boat glided silently through the canal.

Arman: — “Have you ever wondered why people here argue less?”

Saman: — “Because water absorbs sound… and when sound decreases, anger decreases too.”

Nazanin: — “And because no one is in a hurry.”

Raha: — “Why hurry?”

Arman: — “To arrive. Here, arrival has already

happened.”

Saman glanced at his wrist display. — “The artificial intelligence is now slightly adjusting the water flow.”

Raha: — “Why?”

Saman: — “Because more people are outside today. The city is cooling itself.”

Nazanin: — “That’s what they call eco-theology.”

Arman turned his head: — “What do you mean?”

Nazanin: — “It means accepting that humans are not the owners of nature; they are partners. We don’t command here… we participate.”

Raha: — “Like a team game?”

Nazanin: — “Exactly.”

Arman: — “Land-based cities always thought they should control nature. Build walls, build dams, restrict it. But Niyaee learned to listen.”

Saman: — “That’s why this city doesn’t age. It just matures.”

The educational boat docked. Raha jumped off.

Raha: — “Our teacher said our city is like a ship.”

Arman: — “She’s right.”

Saman: — “A ship that is standing still… but always ready to move.”

Nazanin: — “And most importantly, a ship where everyone is a passenger, not a visitor.”

Raha paused. — “What does that mean?”

Arman: — “It means no one here is just a consumer. Everyone is responsible.”

Raha: — “Even me?”

Nazanin leaned down to her level: — “Especially you.”

The sun was slowly approaching the horizon. The reflection of light on the canals made the city appear multi-layered.

Saman: — “Do you know why modern cities are afraid of the future?”

Arman: — “Because they are built on absolute land. They have no flexibility.”

Nazanin: — “And because the future will be like

water… not like concrete."

Raha: — "I want to grow up and become a boat builder."

Arman smiled: — "You're choosing the future."

Saman: — "Not just a profession… but a way of looking."

Night slowly arrived. The lights didn't turn on; only the intensity of the light diminished.

Nazanin: — "You know, Arman… Niyaee isn't just a city."

Arman: — "I know."

Saman: — "It's an ethical response."

Raha: — "To what?"

Nazanin: — "To that old question: How is humanity supposed to live on Earth?"

Arman: — "And the answer is: like water… without possession, without destruction."

Saman: — "And with intelligence, not force."

The wind blew again.

The city remained calm.

The water continued its course.

And Niyaee, not against the sea, but along with it, continued to live.

A Philosophical and Aesthetic Contemplation of the Niyaee Planetary Water-Centric City

A philosophical and aesthetic contemplation of the Niyaee Planetary water-centric city is, at its core, a reconsideration of the relationship between humanity, nature, time, and meaning. The water-centric city is not merely a physical or engineering model, but a worldview in which “water” ascends from a physical element to an ontological, ethical, and aesthetic principle. In this perspective, the city is no longer a machine for production and consumption, but a living, dynamic entity in constant dialogue with its surroundings—an entity that, like water, flows, adapts, and possesses a profound and enduring power despite its apparent gentleness.

From a philosophical standpoint, water has always been a symbol of beginnings. In ancient myths, from

Mesopotamia to ancient Persia, from Greece to the Far East, water has been considered the source of life, purification, and rebirth. The Niyaee Planetary water-centric city consciously or unconsciously returns to this ancient memory. Such a city reminds humanity that civilization is not born from dominion over nature, but from coexistence with it. In contrast to modern land-centric cities, which are founded on the logic of dominance, severance, demarcation, and stabilization, the Niyaee Planetary city advances the logic of fluidity, interconnectedness, and acceptance of change. This paradigm shift, at a philosophical level, marks a transition from a metaphysics of domination to an ethics of participation.

In the Niyaee Planetary water-centric city, humanity is no longer the "absolute center," but rather one component of a living, intelligent whole. This perspective resonates deeply with contemporary environmental philosophies, particularly ecotheology and environmental ethics. Ecotheology emphasizes the principle that nature is not a tool of humanity, but a trust for which humanity is responsible. The Niyaee Planetary water-centric city is a physical embodiment of this responsibility. When water channels regulate the

city's breath, when humidity softens the air, and when human transit is replaced by boats instead of automobiles, the city practically teaches humanity that ethical living is a life harmonized with the rhythms of nature.

From an aesthetic perspective, water possesses a quality that no other element can replicate: reflection. Water reflects light, layers images, and presents reality in a soft and poetic manner. The Niyaee Planetary water-centric city is a city where beauty is intrinsic, not ornamental. Beauty is born from the flow of water, its gentle murmur, the movement of boats, and the play of light and shadow on the surface of the canals. This type of beauty, unlike the boisterous beauty of modern cities, is tranquil, enduring, and healing. In such a city, humanity does not consume beauty; it lives within it.

Water also carries a certain philosophy of time. Time in modern cities is linear, accelerated, and based on productivity. But the time of water is the time of flow, not a race. The Niyaee Planetary water-centric city unconsciously slows the rhythm of life, making it more human and contemplative. The movement of a boat compels one to look around, to pay attention to the journey, not just the destination. This subtle shift has a

profound effect on the collective psyche. Anxiety, a product of speed and density, subsides in such a space. In its place, a sense of presence, belonging, and tranquility emerges.

At the level of urban anthropology, the Niyaee Planetary water-centric city redefines the concept of "dwelling." Dwelling here does not mean occupying space, but rather harmonizing with it. Homes, streets, docks, and public spaces are all designed in continuous dialogue with water. This dialogue transforms humanity from a consumer of space into an active participant in the urban ecosystem. The coastal human of the future is one who confronts climate change not through denial or blind resistance, but through intelligent adaptation.

The Niyaee Planetary water-centric city also offers a profound critique of the logic of power prevalent in contemporary cities. In land-centric cities, power manifests in concentration, height, skyscrapers, and the appropriation of land. But in the water-centric city, power resides in distribution, balance, and flexibility. Water is inherently non-concentrative; if it accumulates excessively in one place, it floods. Therefore, the Niyaee Planetary city compels humanity to distribute

resources, space, and opportunities equitably. This characteristic possesses a deeply political and ethical dimension.

From the perspective of the philosophy of technology, the Niyaee Planetary water-centric city establishes a different relationship with technology. In this city, technology is not a tool of domination, but a tool of harmonization. Artificial intelligence, autonomous systems, and smart networks are not employed to increase endless speed, but to maintain balance, reduce pressure, and anticipate needs. This perspective is closely aligned with the views of thinkers like Martin Heidegger, who cautioned against technology detached from meaning. In the Niyaee Planetary city, technology is once again placed in service of “being,” not merely “doing.”

The aesthetics of the Niyaee Planetary water-centric city is an aesthetics of humility. No structure seeks to dominate water; rather, it sits alongside it. The horizon remains open, the sky is visible, and the city whispers rather than shouts. This whisper has an educational effect. Children who grow up in such a city become attuned to the concepts of balance, patience, and respect for nature. This aesthetic education is perhaps

the most significant achievement of the Niyaee Planetary water-centric city.

The water-centric city is a response to the crisis of meaning in contemporary urban living. When cities have become a source of psychological distress, alienation, and disconnection from oneself and nature, the water-centric city offers the possibility of reconciliation: reconciliation with one's own body, with time, with the environment, and with others. This city views the future not as a threat, but as a possibility—a future in which humanity learns to live like water: flowing, adaptable, transparent, and profound.

We, standing on the threshold of a century in which the earth groans under the pressure of speed, aridity, pollution, and semantic fragmentation, declare that the urban model based on domination, endless consumption, and denial of nature has reached its end. Future cities, if they are to survive, must be built not against nature, but in alignment with it. And water is the first and most fundamental teacher of this future.

The Niyaee Planetary water-centric city is not merely a city with canals, docks, or waterborne transportation; it

is the embodiment of a fundamental shift in humanity's relationship with the world. In this city, water transforms from a "resource" to a "principle"—an ontological principle that teaches us how to live, how to move, and how to redefine meaning. Water teaches us that power does not necessarily reside in rigidity and strength, but in flexibility, interconnectedness, and the capacity for adaptation.

We declare that future cities must distance themselves from the logic of land-centricity—a logic based on severance, harsh demarcation, excessive stabilization, and the illusion of absolute control. In contrast, the water-centric city is founded on the logic of flow, balance, and coexistence. Such a city accepts that change is not a threat, but the very essence of life. Therefore, instead of resisting natural forces blindly, it harmonizes with them.

In the Niyaee Planetary water-centric city, humanity is no longer the ruler of nature, but one component of a complex, living system. This city is a physical expression of environmental ethics—an ethics founded on responsibility, participation, and care. Water reminds us that every human action creates a ripple that returns to us. Therefore, city design is the design of

collective ethical behavior. We believe that beauty in future cities should not be the product of artificial ornamentation and ostentatious structures, but should be born from the essence of natural elements and the manner in which humanity is present alongside them. Water, through the reflection of light, sound, movement, and time, creates an aesthetic quality that is simultaneously calming, contemplative, and educational. The Niyaee Planetary water-centric city does not shout beauty; it allows it to flow.

Time in the water-centric Niyaee city is redefined. We declare that haste is no longer a measure of progress. Boat movement instead of cars, pausing instead of overtaking, and the route instead of the destination, return new values to the city. The water-centric city revives human time; a time in which “being” takes precedence over “arriving.”

From an economic perspective, the water-centric city rests on a dynamism based on water; maritime trade, fisheries industries, sustainable agriculture, tranquil tourism, and a circular economy. This city, instead of excessive extraction, relies on regeneration and balance. Water is not only a carrier of goods, but a carrier of life, employment, and meaning. Water

security is civilization security. We emphasize that future water-centric cities must build their infrastructure on intelligence, not force. Technology, particularly artificial intelligence, does not play a governing role in these cities; rather, it fulfills the role of “balancer.” Technology should be used to regulate flows, predict needs, and reduce pressure on humans and nature, not to intensify speed and exploitation.

The Niyaee water-centric city is a city in which power is distributed, not concentrated. Water teaches us that excessive concentration breeds upheaval. Therefore, spatial equity, equal access to resources, and the elimination of points of tension are fundamental principles of this city. The water-centric city is inherently anti-anxiety; because it disperses pressure, rather than accumulating it.

We believe that the human of the future will be a coastal human; not necessarily in a geographical sense, but in a philosophical one. A coastal human is someone who lives on boundaries: the boundary of land and water, the boundary of nature and technology, the boundary of the individual and the collective. This human, instead of denying boundaries, understands them and makes them their home.

Ultimately, we declare that the water-centric city is a civilizational response to the crisis of meaning in contemporary living. This city provides the possibility of reconciliation: reconciliation with one's own body, with time, with others, and with the Earth. The water-centric city of the future is a city that moves towards the future, not against nature, but alongside it.

We declare this manifesto not as a dream, but as a necessity. The future will be water-centric, or it will be unsustainable.

Chapter Five: The Niyaee Planetary City: A City of Safety

In cities that for centuries have been shaped by the imperatives of speed, competition, and the conquest of space, safety has consistently been a secondary concern—a concept retrofitted after the occurrence of danger, with control mechanisms, deterrent laws, and surveillance systems. But the Niyaee Planetary city begins from a fundamentally different point: the elimination of the very source of threat. In this city, safety is not an emergency response, but an inherent quality of the space itself; not a product of control, but the result of thoughtful design. The absence of automobiles from the city's surface is not merely a traffic decision, but a redefinition of the relationship between humanity, the environment, the body, and one another. A place where the street is no longer a field of danger, but an extension of home and the collective memory of citizens.

In Niyaee, the city is no longer a place of transit, but a place to remain. Psychological safety begins here: from the moment a child plays freely in open squares without fear of metal and speed; from the time an elderly person can take their gentle steps across the city's surface

without anxiety; and from the point where parents, instead of constant worry, experience a conscious presence alongside their families. The absence of automobiles on the city's surface frees the human mind from a state of perpetual readiness. There is no longer a need to constantly scan for sounds, horns, and sudden movements. The mind is liberated to see, hear, and feel again.

Safety in the Niyaee city is not merely physical safety; it is also mental and emotional safety. Contemporary modern cities, even when accident statistics decline, continue to reproduce anxiety, because their governing logic is one of spatial competition and speed. But Niyaee, by providing five-minute access to services, eliminates the need for haste at its foundation. When no destination is far, movement is no longer a race. This subtle but fundamental shift shifts safety from the level of law to the level of perception. Humanity feels that the space is not an enemy, but an ally.

In this city, surface transportation devices are not instruments of danger, but instruments of interaction. Bicycles, scooters, boats in the canals, and solar-powered gondolas humanize the rhythm of movement. The body regains meaning within the scale of the city.

Physical safety is the result of the synchronicity between the body and the space—a time when the speed of movement is in harmony with the human capacity for perception. In Niyaee, the body is not forced to adapt to the machine, but the city is designed to adapt to the human body. This harmony naturally reduces violence; for many social tensions are rooted in spatial and temporal pressures.

From a sociological perspective, a safe city is one in which human relationships are predictable, transparent, and non-aggressive. The absence of automobiles on the city's surface softens the hard boundaries between individuals. Glass and metal no longer distance gazes. Eye contact, pauses, and even silence become part of everyday language. These qualities of softness form the foundations of social safety. In such a space, crime diminishes not through force, but through a reduction in motivation and opportunity. When the city itself cares for its citizens, the need for a constant, invisible police presence diminishes.

Safety in Niyaee is also rooted in technology, but not in a domineering technology. Smart systems and artificial intelligence, in this city, play a predictive and balancing role, not a punitive oversight role. Smart infrastructure

manages flows to prevent congestion, pressure, and danger. Just as in a bee colony, safety is achieved through coordination, not command, so too in Niyaee, safety is the result of the intelligent distribution of decisions. Technology is in service of tranquility, not control.

From a philosophical perspective, the Niyaee city of safety is a response to the existential crisis of modern humanity. Humanity has lived for centuries in cities that constantly warned them: be careful, hurry, be afraid. Niyaee reverses this narrative. The city tells humanity: stay, look, trust. This trust builds a new ethical foundation—an ethics in which collective responsibility replaces individual fear. When space is safe, humanity also thinks and acts more safely.

The absence of automobiles on the city's surface also links environmental safety to human safety. Silence, clean air, and the absence of noise and visual pollution strengthen psychological well-being. Safety is no longer merely about survival; it is about living well. Niyaee demonstrates that true safety is achieved when humanity is no longer forced to live in a constant state of defense.

Instead of taming citizens with complex laws, this city liberates them through the simplicity of its design. Safety in Niyaee is the result of eliminating structural dangers, not adding layers of control. This is where the city transforms from a machine for managing populations into a platform for civilization—a platform where children, the elderly, families, and solitary individuals all feel a sense of belonging and tranquility.

The Niyaee city of safety is a promise of restoring trust in urban living—a trust that has been shattered under the wheels of speed and anxiety in modern cities. This city demonstrates that safety, if embedded in the logic of space from the outset, will no longer require shouting, fences, or warnings. Safety, in Niyaee, is a whisper—a calm, constant, and human presence.

***

Night has not yet fully arrived. The city's light doesn't turn off, nor does it shine brighter; it simply remains calm. The water canal flows like a bright line through the silence. Arman, Nazanin, Saman, and Raha are seated on stone platforms beside the water. There are no vehicles. No sounds of emergency are heard. Raha stirs her feet in the water. Raha: — "Dad… why isn't it

scary here at night?”

Arman pauses. He looks at the city, not the sky. Arman: — “Because this city has nothing to hide.”

Nazanin says softly: — “And nothing to attack.”

Saman offers a short smile: — “True security is always this quiet.”

Raha tilts her head. — “But in the old city, night meant locking up, rushing, being careful.”

Saman: — “That city was designed on fear. Niyaee is designed on trust.”

Arman: — “And trust is only possible when speed is removed from the equation.”

Raha: — “Like cars?”

Nazanin: — “More than cars… The logic of cars.”

Saman leans towards the water. His reflection shimmers in the canal. Saman: — “A car isn’t just a vehicle. It’s a philosophy. A philosophy that says you’re always late, always behind, always someone is ahead.”

Arman: — “And that feeling of being behind creates fear.”

Nazanin: — “Fear creates violence.”

Raha: — “So why doesn’t anyone fear here?”

Saman: — “Because no one has to run here.”

A gentle breeze blows. The pedestrian pathway lights glow like the city’s steady breaths. Arman: — “The security of Niyaee didn’t begin with police, it began with a plan.”

Nazanin: — “With the decision that no one in the city would move faster than the human body.”

Raha: — “Not even the drones?”

Saman laughs. — “Not even the drones. They too have a rhythm.”

Arman: — “When speed is tamed, violence becomes meaningless.”

Nazanin: — “And when violence becomes meaningless, security is no longer a project; it’s a state.”

Raha: — “So why don’t other cities do this?”

A short silence falls. A silence that thinks. Saman: —

“Because eliminating cars means eliminating an industry, eliminating a habit, eliminating an illusion.”

Arman: — “The illusion of control.”

Nazanin: — “The illusion that the faster you are, the safer you are.”

Raha: — “But here, we are slow… and safe.”

Arman smiles. — “Because security is the product of conscious slowness.”

A little further on, a group of elderly people stroll peacefully.

No one stops beside them to watch over them. The city itself watches.

Nazanin: “Do you know when I realized this city was safe?”

Arman: “When?”

Nazanin: “When I saw my mother, alone, at night, crossing the canal… and didn’t even look over her shoulder.”

Samaneh says softly: “In insecure cities, people live

looking behind them."

Raha: "Here, we only look forward."

Samaneh: "Because forward is no longer a threat."

Arman: "The Niyaee city is prevention, not reaction."

Nazanin: "Cities that are designed reactively always understand too late."

Samaneh: "And the Niyaee city understands early… because it listens."

Raha: "To what?"

Samaneh: "To footsteps. To pauses. To people's breaths."

The wind grows slightly stronger. But even the wind is harmless.

Arman: "Safety isn't just about bad things not happening."

Nazanin: "It's about the mind not expecting bad things to happen."

Raha: "I don't have bad dreams here."

Samaneh, quietly: “That means the city respects your unconscious.”

Silence returns. Not as an absence of sound, but as the presence of meaning.

Arman: “A safe city is a city where children don’t have escape plans.”

Nazanin: “And where the elderly don’t have defense plans.”

Samaneh: “And no one is forced to be a hero.”

Raha: “So the Niyaee city isn’t a city of heroes?”

Arman: “No. It’s a city of humans.”

The light dims slightly. But darkness doesn’t arrive.

Samaneh: “In Niyaee, safety is the result of eliminating danger, not managing it.”

Nazanin: “And that’s the difference between civilization and survival.”

Raha: “So, we’re not just alive here?”

Arman places a hand on her shoulder. “No… We’re living here.”

The city says nothing. But the paths are clear. The speeds are human. And no one, anywhere, is afraid.

***

It is not a utopian ideal, nor a fleeting response to environmental or traffic crises, but a civilizational stance against an urban planning paradigm that, for the past century, has relegated humanity to the margins and the automobile to the forefront of urban life. This manifesto rests on the fundamental principle that security, before being a product of surveillance, control, or reaction, is the result of conscious and ethical space design. A secure city is one in which danger is eradicated at its root, not merely managed.

In a city secure without cars, security begins with the elimination of instruments of death and threat from daily life. The automobile, the most significant source of physical, psychological, and social risk in modern cities, is removed from the urban landscape, its function transferred to subsurface layers, autonomous clean systems, or logistics networks inaccessible to citizens. This removal is not a restriction of freedom, but a restoration of it—freedom of movement, freedom of presence, freedom of living without fear.

This city believes that true security is the product of slowing down to the natural rhythm of humanity. Any system that increases speed beyond the human capacity for perception and reaction inevitably produces anxiety, violence, and insecurity. A city secure without cars returns speed to a level where the body, mind, and space remain in harmony. In such a city, walking, cycling, light scooters, boats, and clean aerial and terrestrial systems are not alternative options, but the primary modes of transportation.

This manifesto declares that security is, before being a policing issue, a spatial and ethical one. Urban design that reproduces long distances, spatial inequality, and excessive concentration of services remains insecure, even with the highest level of surveillance. Conversely, a city that guarantees equitable, rapid, and humane access to essential services will naturally possess a high level of psychological and social security. Therefore, a city secure without cars is committed to the model of short temporal access—like the fifteen-minute city—to eliminate the need for risky and exhausting commutes altogether.

In this city, children grow up without being taught to fear, the elderly move without defensive strategies, and

women are present in public spaces without constantly calculating risk. Security is not a special privilege for a particular group, but the default status of collective life. A city secure without cars transforms security into a public and universal right, not a commodity to be bought or a privilege dependent on social status.

Technology and artificial intelligence do not play a governing or supervisory role in this model, but rather balancing and preventative tools. Their mission is not to predict crime, but to eliminate the conditions that produce it; not to control human behavior, but to intelligently regulate flows, pressures, and the spatial distribution of resources. A city secure without cars rests on the principle that extensive surveillance is a sign of design failure, not success.

This manifesto emphasizes that sustainable security is only possible in a city built on trust in humanity. Cities designed on the assumption of error, threat, and deviation contribute to the reproduction of distrust and violence themselves. Conversely, a city secure without cars is shaped on the assumption of human health, cooperation, and rationality, and transforms security into an internal and sustainable condition through spatial transparency, social presence, and the

elimination of hazardous points. A city secure without cars declares that the future civilization is not a civilization of reaction, but a civilization of prevention; a civilization that, instead of adding layers of control, dries up the roots of danger. This city is not governed by walls, weapons, or fear, but by light, the human rhythm, equitable access, and the elimination of threats from daily life.

Ultimately, this manifesto proclaims: A city is secure when one does not need courage to survive; a city where security is not an exception, but the natural state of living. A city secure without cars is not a luxury choice, but an ethical, environmental, and civilizational necessity of the twenty-first century.

***

Security doesn’t begin where a camera is installed, nor where a guard stands, nor where a wall rises. Security begins where something has been removed.

Araman understood this the first time he saw a child, without glancing around, cross a pedestrian plaza. Not holding a mother’s hand, not hearing a warning voice. No fear in their body, no learned caution. They didn’t cross; they walked.

Araman murmured, “This is the most dangerous thing that could be safe.”

Saman stood beside him.

“No. This is the most natural thing we’ve been deprived of for centuries.”

In Niyaee, security is not a system; it’s the result of a conscious removal: the elimination of automobiles from the urban landscape.

Nazanin later said, “For years, we thought security meant more control. But we never asked: What can we remove so that control is no longer needed?”

In modern cities, security is reactive. Signs appear after accidents. Crosswalks after deaths. Laws after tragedies. But Niyaee was designed from the outset to avoid tragedy altogether.

Saman had said in one public forum, “Cities built on the assumption of error assume that people are flawed. Niyaee is designed on the assumption of health.”

And that assumption changed everything. When automobiles were removed from the urban landscape, not only was the risk of accidents eliminated, but the

mindset of risk collapsed. Children no longer needed to be taught to “be careful.” Elderly people no longer had to memorize complex and frightening routes. Mothers no longer saw the city as a field of threats. The sidewalk was no longer a margin; it was the heart of life.

Once, Raha asked, “Dad, why doesn’t anyone tell me to be careful here?”

Araman replied, “Because here, the city is mindful, not hazardous.”

In Niyaee, psychological security was deemed more important than physical security. Because the city planners understood that a body constantly in a state of readiness, even if it experiences no harm, becomes exhausted.

Nazanin, who had lived in densely populated cities for years, said, “There, it always felt like something bad was waiting just around the corner.”

Saman responded, “Because speed takes the mind ahead of the body. And the mind that’s ahead is always afraid.”

In Niyaee, speed was returned to the rhythm of humanity—not as a limitation, but as an ethical return.

In this city, nothing moves faster than the natural reaction of a human being. No vehicle, no system, not even artificial intelligence. And that is the greatest guarantee of security.

Artificial intelligence in Niyaee is not used to predict crime, identify suspects, but to balance pressures.

Saman had explained, “We weren’t looking to predict evil; we were looking to eliminate the conditions that give rise to it.”

In Niyaee, no place becomes overly crowded, no route becomes overly burdened, no service becomes too distant. Because it is a fifteen-minute city. And distance is the mother of insecurity. Araman once wrote, “The greater the distance, the greater the anxiety; and the greater the anxiety, the more likely violence becomes.”

Niyaee broke that chain. In this city, women do not consider nights “a second time of danger.” Children do not experience space as “limitation.” Elderly people do not see the city as “an obstacle.”

Security in Niyaee is provided not by police, but by equitable design. And that is where the city becomes a manifesto.

Niyaee declares: Security is the product of eliminating spatial inequality. Security is the product of eliminating inhuman speed. Security is the product of eliminating instruments of death from daily life. And above all: Security is the product of trust in humanity.

One evening, Raha said, “What if someone wants to do something bad?”

Saman replied, “In a city where there is nothing to seize, where routes are short, and everyone is seen without being watched, evil is left alone.”

Nazanin quietly added, “And evil is afraid of solitude.”

Niyaee is not a city of walls. It is a city of light. It is a city of visibility, not surveillance. It is a city of participation, not control. And for that reason, it is the most secure city possible.

Finally, Araman wrote this sentence for the fifth chapter—not as poetry, but as a definition of civilization:

“A city is secure when a child does not need courage, a woman does not need caution, an elderly person does not need a defense plan, and a human being does not need fear.”

A Philosophical and Aesthetic Perspective on the Secure Niyaee City

The secure Niyaee City arises from a fundamental question: Is security something that must be imposed upon humanity, or a condition that must be made possible? In the historical experience of modern cities, security has often been defined in terms of surveillance, control, cameras, fences, laws, and reaction—as if the city is inherently a dangerous place and humanity a potentially flawed being that must be restrained. The secure Niyaee City challenges this premise, understanding security not as a result of external pressure, but as the product of a well-designed relationship between humanity, space, and movement.

In Niyaee, security is not primarily a political or administrative phenomenon; it is an ontological one. This city rests on the principle that a significant portion of urban insecurity does not stem from "human malice," but from the "incompatibility of structures with the human body and mind." Unhuman speeds, exhausting distances, uneven densities, and the dominance of the automobile over space have transformed humans into beings constantly on alert. By eliminating the automobile from the urban landscape,

Niyaee removes the first and most fundamental source of threat from everyday life, returning security from an emergency state to a natural one.

The aesthetics of the secure Niyaee City are the aesthetics of tranquility—not a decorative tranquility, but a structural one. In this city, beauty is not found in towering skyscrapers or ostentatious forms, but in the "predictability of space" and the "reliability of movement." When a child can move through space without being taught to fear, when an elderly person does not need courage to cross the city, and when the human body is not compelled to react suddenly for survival, the city reaches a level of beauty unknown in bustling modern cities. This is the beauty of eliminating danger, not decorating it.

From an ethical perspective, the secure Niyaee City offers a radical redefinition of collective responsibility. In this city, responsibility for security is not placed on the individual; citizens are not compelled to constantly watch out, predict, fear, or prepare to react. Responsibility is elevated to the level of design. The ethics of Niyaee are ethics of prevention, not punishment. Rather than searching for a culprit after an incident occurs, this city makes the conditions for an

incident to occur fundamentally impossible. Within such a framework, security is not a reward for obedience, but a right to live.

The hidden theology of the secure Niyaee City is a theology that considers humanity as a steward of the Earth and space, not a heedless consumer. The elimination of the automobile from the urban landscape is not merely a technical or environmental decision; it is an ethical statement against the violence embedded in contemporary urbanism. In this view, the loss of human lives in traffic accidents is not considered the price of "progress." Life possesses an inviolable dignity, and the secure Niyaee City embodies this dignity in its very form.

From a phenomenological perspective, living in the secure Niyaee City is an experience of the body returning to the center of perception. In automobile-centric cities, the body is constantly in a state of contraction—muscles prepared for reaction, the mind ready to flee, and attention scattered. In Niyaee, the body returns to a state of active stillness—movement without fear, presence without constantly calculating risk. This return of the body is itself a form of liberation, transforming security into a lived

experience, not an abstract concept.

Niyaee is also a critique of the prevailing notion of "freedom of movement." Freedom in modern cities is often measured by the speed and power of the automobile, but this freedom in practice has led to the enslavement of the mind and body. Niyaee demonstrates that true freedom is freedom from danger, not freedom for danger. When humans are no longer forced to fight to arrive, calculate to cross, and fear to exist, authentic freedom returns.

From an urban aesthetic perspective, the elimination of the automobile leads to the elimination of harsh sounds, toxic smells, and nervous rhythms. Silence in Niyaee is not the silence of absence, but the silence of balance. Sounds are natural: water, wind, footsteps, conversations. This auditory quality contributes to the city's psychological security. Security is not only the absence of incident, but the presence of a sense of assurance—an assurance born from the harmony of the senses with space.

In conclusion, the Niyaee City can be understood as a "Planetary manifesto"—a declaration that the future of cities lies not in the accumulation of control

technologies, but in the redesign of the relationship between humanity and space. This city elevates security from an instrument of power to a quality of life, demonstrating that a mature civilization is one in which humans do not need to be heroes to survive.

The Niyaee safe city is a city of eliminating fear—not by denying danger, but by eliminating its roots. A city where security is not an event, but a state; not an exception, but a rule. Such a city is not merely a place to live, but a new horizon for thinking about the future of humanity.

The Theoretical Framework of Algorithms in the Niyaee Planetary city

The Niyaee Planetary city is founded on the fundamental principle that the city of the future is not a collection of streets and buildings, but a "cognitive-biological system"—a system that, like a living organism, learns, adapts, establishes equilibrium, and cares for itself. In such a city, an algorithm is no longer merely a computational instruction, but an embodiment of the inherent rationality within the city's structure. Algorithms in Niyaee are the hidden language of the city—a language that translates between data, ethics,

space, and humanity. In contemporary modern cities, algorithms are often designed to increase economic productivity, manage traffic, or control consumption, but they lack a deep connection to urban anthropology. The result is that the city becomes “smart,” but humans feel alienated within it. Niyaee precisely breaks away from this point. In this city, an algorithm is not primarily an optimizer, but a “meaning-maker”—that is, it first asks: What impact will this decision have on human tranquility, security, lived time, and dignity?

The theoretical framework of Niyaee draws inspiration from three primary sources:

First, the theory of adaptive complex systems; Second, bio-algorithms and the collective behavior of social creatures like bees; And third, the philosophy of technology ethics.

In adaptive complex systems, no single element holds absolute control, yet the entire system exhibits intelligent and stable behavior. Niyaee has precisely this structure. There is no “central command center,” but decisions are made in a decentralized, local, and coordinated manner. This feature makes the city resilient to crises, disruptions, and climate change.

Furthermore, inspiration from bee colonies teaches Niyaee how to manage millions of simultaneous movements without competition, traffic, accidents, or chaos. In this model, each agent (autonomous vehicle, boat, drone, bicycle, application) adjusts its behavior according to the state of the entire system, not based on short-term individual interests.

The ethical dimension of algorithms is the third pillar of this framework. In Niyaee, no algorithm is permitted to make a decision that increases anxiety, insecurity, or temporal inequality. This principle elevates Niyaee from a “Smart City” to a “Wise City”—a city that is wise, not merely intelligent.

Algorithms in Niyaee seek to optimize balance rather than maximize speed. They strengthen coexistence rather than competition. They prefer structural prevention over control. And they consider minimizing waste to be the measure of progress.

Within this framework, urban applications are not tools of dependence, but tools of empowerment. The citizen is not a “user,” but a “system collaborator.” The city does not command the citizen; it engages in dialogue with them, receives data, provides feedback, and learns.

The Macro-Architecture of Niyaee's Intelligent Systems

The Niyaee Planetary city is designed not on the basis of the linear logic of conventional smart cities, but on the basis of a biological-cognitive layered architecture. In this city, intelligent systems do not function as isolated islands, but as an integrated ecosystem—an ecosystem in which data, space, humanity, and ethics are in a continuous cycle of interaction. This architecture can be called the "Niyaee Urban Intelligence Stack"—a structure that extends from the lowest physical layer to the highest ethical decision-making layer.

In prevalent smart cities, system architecture is often technology-centric; that is, the tool and platform are defined first, and then efforts are made to adapt humans and the city to them. But in Niyaee, this logic is reversed. The starting point of the design is the "lived experience of the human being," and technology only enters when it can simplify, secure, and make that experience more meaningful. Therefore, the macro-architecture of Niyaee's systems is designed in a layered but non-hierarchical manner.

The first layer is the physical-environmental layer. This layer includes vehicle-free infrastructure, waterways, pedestrian paths, bicycle lanes, docks, peripheral green spaces, and subsurface corridors for logistics. Data in this layer is collected through environmental sensors, air quality monitoring systems, humidity, temperature, water flow, and human traffic levels. The key point is that these sensors are designed not to control humans, but to "understand the state of the city." At this level, the city is like the human body, recording vital base information.

The second layer is the mobility and temporal layer; where the concept of the fifteen-minute city takes on algorithmic meaning. In this layer, time-based algorithms replace distance-based algorithms. Unlike conventional cities, where distance is the primary planning criterion, in Niyaee, the time of access to services is the main unit of analysis. Data in this layer includes walking time, cycling time, boat movement, scooters, and even deliberate human stops. Stopping in Niyaee is not an "error," but a part of the city's rhythm.

The third layer is the hidden and subsurface logistics layer. One of Niyaee's fundamental innovations is the complete separation of human movement from goods

movement. In this layer, optimization algorithms for goods flow operate without interfering with the citizens' living space. Autonomous underground vehicles, distribution robots, and intelligent scheduling systems transport goods from docks to local hubs without citizens even noticing their presence. This principle, "urban surface tranquility," is one of the fundamental differences between Niyaee and conventional smart cities.

The fourth layer is the adaptive artificial intelligence layer. In this layer, data collected from the environment, time, movement, and energy consumption are analyzed, not to predict alone, but to learn the city's biological patterns. Artificial intelligence in Niyaee behaves like a decentralized nervous system; instead of issuing absolute commands, it offers gradual suggestions. For example, if pressure on the use of a service increases in a neighborhood, the system subtly distributes the flow in space and time.

The fifth layer is the human-city interaction layer, which takes shape through urban applications, minimalist visual interfaces, and non-intrusive environmental cues. Niyaee applications, unlike common ones, do not encourage citizens to consume

more or move faster. These applications are based on three principles: transparency, agency, and tranquility. The citizen knows what data is being collected from them, has the right to choose, and is never bombarded with anxiety-inducing notifications.

In this layer, the concept of a "silent interface" becomes important; many intelligent city decisions are made without the need for active user intervention. The city adapts to the human, not the other way around. This principle is one of the most fundamental differences between Niyaee and the technocratic smart city model.

The sixth and final layer is the layer of ethics, governance, and meaning. At this level, algorithms operate under the supervision of pre-defined ethical principles. No decision is accepted solely on the basis of efficiency or economic profit unless it is consistent with the criteria of psychological security, temporal justice, environmental sustainability, and human dignity. This layer can be called the "algorithmic conscience of the city."

In this architecture, Niyaee is not a machine for habitation, but a living entity in dialogue with its inhabitants. Every application, every algorithm, and

every urban decision within this framework is part of a larger narrative: a narrative in which the city does not force humans to run, but allows them to live.

This macro-architecture forms the basis for the development of all Niyaee's specialized algorithms—from vehicle-free transportation to pre-built security, from water-based economy to time management. Each of these areas will be explored in detail in subsequent sections, and the corresponding algorithms and applications will be elaborated.

Algorithms for Vehicle-Free and Intersection-Free Transportation in the Niyaee Planetary City

Transportation in the Niyaee Planetary City is not a separate subsystem, but the backbone of urban order. Unlike contemporary modern cities, where transportation has emerged as a belated response to unplanned urban sprawl, in Niyaee, transportation has been designed from the outset in conjunction with architecture, time, security, and human well-being. Consequently, the mobility algorithms in this city are based on the principle of "preventing conflict" rather than "managing conflict."

In conventional cities, intersections, traffic lights, and

signs are a sign of design failure—because their existence means that routes intersect and clash with each other. Niyaee eliminates the issue of intersections altogether by completely removing automobiles from the urban landscape and transferring all motorized traffic to subsurface layers. This removal is not a purely aesthetic decision, but the result of a deep algorithmic logic.

The transportation algorithms of Niyaee are designed on three fundamental principles:

1. Separation of layers for human and machine movement
2. Elimination of human decision-making from motorized traffic
3. Replacing static signs and laws with dynamic adaptive intelligence

In the subsurface layer, the network of autonomous vehicle movement is designed as a continuous multi-dimensional graph. Unlike classical street networks, which have a graph consisting of intersection nodes and route edges, the mobility graph in Niyaee lacks level-surface nodes. Routes are either designed as

parallel tunnels or pass over each other at precise millimeter-level elevations. This structure enables the implementation of “Continuous Flow Algorithms”—algorithms in which absolute stops are meaningless.

In this system, each autonomous vehicle functions as an independent agent, but its decisions are not entirely individual. Each agent is connected to a collective intelligence that operates similarly to a bee colony. No vehicle chooses its route solely based on the shortest distance; the primary criterion is minimizing network pressure. This pressure is a combination of time, energy, density, and the psychological well-being of citizens.

In the mathematical model of this system, the objective function is defined as multi-objective:

- Minimizing delivery time
- Minimizing energy consumption
- Minimizing local density
- Maximizing urban silence
- Maximizing predictability of movement

This objective function is continuously and in real-time

reconfigured. The central artificial intelligence does not act as a dictatorial controller, but as a rhythm coordinator. If demand increases in an area, the system does not increase speed or density, but adjusts the temporal distribution of deliveries; the city “breathes” rather than “pressurizes.”

The elimination of signs and traffic signals is the result of this logic. Signs are designed for humans who make their own decisions and are prone to error. In Niyaee, vehicles do not make mistakes and do not need reminders. Laws are embedded in dynamic codes within the algorithms and change according to environmental conditions. For example, at certain times of the day when urban silence is a higher priority, algorithms choose routes that create the least vibration and noise, even if delivery time increases slightly.

At the city level, human mobility follows a completely different logic. Walking, cycling, scooters, and boats do not require rigid control algorithms, but facilitating algorithms. In this layer, the system does not provide direct guidance, but indirect signaling. Changes in light, floor texture, wind flow, and even the sound of water act as environmental signals that shape natural movement patterns.

This approach is inspired by theories of “behavior-based design” and “choice architecture,” but in Niyaee, it has been elevated to a higher level. The city is designed so that the right choice is the easiest choice. A child, an elderly person, and a disabled individual can intuitively choose the safe route without needing to know the law or read signs.

One of the important algorithmic innovations in Niyaee is the “zero congestion prediction” system. By analyzing historical data, seasonal patterns, social events, and even the collective emotional state (extracted from indirect indicators such as movement rhythm and stopping patterns), this system neutralizes congestion before it forms. Congestion in Niyaee is considered an error, not an unavoidable reality.

Compared to contemporary modern cities, where traffic has become part of their identity, Niyaee demonstrates that traffic is not a result of population growth, but a product of flawed algorithmic design. In this city, even with population growth, traffic pressure does not increase, because the network is designed to scale adaptively.

From an energy perspective, the transportation

algorithms in Niyaee are highly optimized. The use of clean energy, regenerative braking, adjusting speed based on slope, and even coordinating the flow of movement with the flow of water in canals are all factored into the computational model. The goal is not movement; the goal is "cost-free movement."

Ultimately, the transportation algorithms of Niyaee not only solve the problem of traffic, but also redefine the concept of movement. Movement is no longer a tool for reaching a destination, but a part of the experience of living. This is where science, philosophy, and aesthetics converge in the Niyaee Planetary City.

Algorithms for Time Management

In the Niyaee Planetary City, time is not a peripheral variable, but the most important urban resource. If industrial cities of the 20th century were defined on the basis of "land" and digital cities of the 21st century on the basis of "data," the Niyaee City can be considered the first city designed on the basis of "human time." Consequently, the time management algorithms in this city play a central role in the architecture of the entire intelligent system.

In conventional cities, time is distributed indirectly and

often unfairly. Individuals, depending on their place of residence, income level, vehicle ownership, and job location, spend an unequal share of their time commuting, waiting, and urban frictions. This phenomenon is known in academic literature as “time poverty.” The Niyaee City is consciously designed to eliminate this poverty.

The algorithms of Niyaee’s fifteen-minute city are developed on the basis of the concept of “temporal justice.” Temporal justice means that access to essential services should not occupy more than a certain time threshold of daily life. This threshold in Niyaee is defined as 5 minutes; a number chosen not symbolically, but based on neurological, environmental psychology, and physiological attention studies.

Studies show that time intervals shorter than 5 minutes are processed by the human brain as “part of the present,” not as a “separate task.” Therefore, 5-minute access does not create a feeling of haste and does not evoke a sense of suspension. This finding is directly incorporated into the algorithms of Niyaee.

At the computational level, Niyaee uses time-based maps instead of distance-based maps. These maps,

which are continuously updated by the city's digital twin, show how each citizen has access to services at any given moment. If access to a service in any part of the city exceeds the 5-minute threshold, the system registers it as a "structural disruption."

Algorithms for correcting this disruption do not necessarily involve new construction. In many cases, balance is restored by readjusting land use, changing service hours, or intelligently distributing resources. This is where Niyaee moves away from the logic of market-driven urbanism and towards the logic of "soft optimization."

One of the important algorithmic innovations in Niyaee is the "flexible time" algorithms. Unlike conventional cities, where peak hours, traffic, and service schedules are rigidly defined, in Niyaee, times are fluid. Algorithms analyze residents' behavioral patterns and adjust service hours to prevent pressure from concentrating in a particular period. This temporal distribution prevents the city from ever entering a state of emergency.

Applications related to time in Niyaee, unlike common ones, do not remind users that "they are late." They

primarily act as rhythm regulators rather than warning systems. For example, if a citizen tends to move quickly, the system suggests calmer routes, pause spaces, or changes in activity sequences to harmonize their rhythm with the rhythm of the city. These interventions are subtle, non-coercive, and based on gradual learning.

From an algorithmic perspective, these systems combine machine learning, queuing theory, agent-based simulation, and complex network analysis. But what distinguishes them is their ultimate goal. The goal is not to maximize economic productivity, but to minimize mental and psychological friction.

In contemporary modern cities, time is often transformed into an enemy of humanity. Calendars, alerts, traffic, and queues all exacerbate the feeling of being pursued by time. The Niyaee City redefines this relationship. Time in this city is an ally of humanity, not an enemy. This shift in relationship is one of the deepest philosophical-algorithmic achievements of Niyaee.

From a governance perspective, temporal justice becomes a key indicator. The success or failure of

policies is measured not by economic growth or construction volume, but by changes in the distribution of time. If a policy causes a group of citizens to spend more time commuting or waiting, even if it is profitable, it is deemed unacceptable within the framework of Niyaee.

Ultimately, the time management algorithms in the Niyaee City demonstrate that the future of urban planning lies not in increasing speed, but in reducing waste. The fifteen-minute Niyaee City proves that the quality of life is achieved not through acceleration, but through proximity, harmony, and respect for the human rhythm.

Algorithms for Proactive Security, Risk Elimination, and the Niyaee Vehicle-Free City

Urban security in the Niyaee Planetary City is designed not reactively, but proactively and algorithmically. In modern cities, security is often defined as a “response to incident”—cameras, police, alarms, and emergency systems activate after an event has occurred. This model of security is invariably accompanied by delays, inefficiencies, and psychological stress for citizens. Niyaee, however, has transformed security into a smart,

proactive algorithm—one that identifies and eliminates potential incidents before they occur.

The absence of vehicles on the urban surface forms the foundation of this strategic security. In Niyaee, the urban surface is completely devoid of automobiles. Therefore, the risk of accidents, collisions, and stress associated with driving is completely eliminated. This design constitutes the first prerequisite for creating a physically and psychologically safe environment for all age groups, from children to the elderly. The city's algorithms, leveraging environmental sensing data, regulate the density and speed of autonomous vehicles operating underground to prevent any unwanted pressure on the urban surface.

One of the key elements of Niyaee's security is the "all-encompassing perspective" algorithm. Using artificial intelligence networks, sensors, and real-time data analysis, this algorithm predicts which areas are at risk and intervenes before an incident occurs. These interventions include rerouting drones, adjusting the flow of boats and bicycles, or redistributing service resources. Therefore, the city is not reactive, but proactive and forward-looking.

Psychologically, the absence of vehicles and traffic ensures a reduction in environmental anxiety. Psychological studies show that continuous exposure to hazardous factors, such as high vehicle speeds and complex intersections, leads to increased secretion of stress hormones such as cortisol and adrenaline. Niyaee implements an algorithm for "psychological security" that indirectly enhances the physical and mental health of citizens by eliminating these factors.

The infrastructural algorithms also include population flow simulation models and human density prediction. Inspired by bee colonies, these models are designed to ensure that population, traffic, and service pressure are constantly distributed across different areas of the city. No area becomes overburdened, and no resident is exposed to congestion or functional disruption. This logic is an algorithm that guarantees collective security through networked coordination.

Subsurface autonomous systems are designed to operate with minimal human interaction and to eliminate the possibility of human error. Underground vehicles are powered by clean energy and operate autonomously with artificial intelligence. Their routing and traffic management algorithms are continuously

optimized by the city's digital twin to proactively manage any potential interference with the urban surface or with each other.

In terms of accessibility, smart algorithms optimize travel time and routes so that residents, without the need for a vehicle, can quickly and safely access all services using scooters, bicycles, boats, and gondolas. These algorithms are designed to guarantee both temporal justice and physical security simultaneously. There are no hazardous routes for children or the elderly, and pedestrian areas do not intersect with urban service areas.

Philosophically, the secure Niyaee City is a model of "active security"—a security that not only prevents harm but also creates conditions, through environmental and algorithmic design, in which humans can experience life free from anxiety and risk. This approach is a combination of human-centered urban planning, artificial intelligence, and environmental ethics, rarely seen in urban literature.

These algorithms also ensure social sustainability. In modern cities, environmental hazards and stress lead to reduced social interaction, increased anxiety, and a

widening gap between generations. In Niyaee, algorithms manage space, time, and movement to create a safe and tranquil collective experience that strengthens social cohesion. The city, with its algorithms, becomes like a living organism that prioritizes the well-being, security, and tranquility of its residents.

Overall, the algorithms of the secure Niyaee City are a combination of data, biological logic, environmental prediction, and respect for the human rhythm. These algorithms demonstrate that sustainable urban security is not achieved simply by increasing the number of cameras and police forces, but by intelligent design, eliminating structural risks, and harmonizing the relationship between humans and the environment. The Niyaee Planetary City is a model that future safe and vehicle-free cities can draw inspiration from—a model in which security is not the product of strict laws, but the result of the natural and algorithmic order of the environment.

Concluding Remarks

What has unfolded across the five chapters of this book is not merely a description of an ideal city, nor simply a critique of contemporary modern cities, but a systematic effort to redefine the “meaning of city” within the horizon of a future civilization. The Niyaee Planetary City, in this narrative, emerges as a living organism, an ethical intelligent system, and a human biosphere—a city where technology, nature, time, security, and humanity are not in conflict with each other, but are organized in a balanced and synergistic relationship. The conclusion of such a project must inevitably transcend technical or literary summarization and ascend to a philosophical, anthropological, and civilizational level.

In the first chapter, the vehicle-free city was introduced as the starting point of this system. The elimination of automobiles from the urban surface was not a symbolic decision, but a fundamental intervention in the psychological, social, and spatial structure of the city. In modern cities, the automobile is not merely a means of transportation; it carries the logic of speed, competition, risk, dominance, and anxiety. Niyaee removed this logic from everyday life by completely

transferring automobiles to subsurface, autonomous layers, enabling the city to return to a human scale. The street was no longer a field of threat, but transformed into a space for experience, calm movement, play, conversation, and living. In this chapter, the city demonstrated that security and tranquility are achieved not through greater control, but by eliminating the source of danger—and this was Niyaee's first serious departure from the modern urban model.

The second chapter, focusing on environmental centrality, deepened this departure. Niyaee considers the environment not as a "subject of protection," but as the "foundation of design." The elimination of fossil fuels, the separation of heavy industries from human living space, and complete reliance on clean energy removed the city from a cycle of destruction–repair and placed it within a logic of preventative sustainability. Here, the environment is no longer a victim of development, but a condition for it. Niyaee demonstrated that zero pollution is not a poet's dream, but the result of structural rationality—a rationality that accepts that the health of air, water, and soil is a prerequisite for human physical and mental health. This chapter elevated the city to a sphere of

environmental ethics and transformed the relationship between humanity and nature from exploitation to coexistence.

The third chapter transformed the concept of time and access by introducing the fifteen-minute city. In this chapter, time shifted from a tool of pressure and control to a substrate of meaning and quality of life. Niyaee demonstrated that many of the psychological and social crises of contemporary humanity are the product of imposed distances and wasted times. By organizing services, education, healthcare, recreation, and work within a human access radius, the city moved away from the logic of "running to arrive" and closer to the logic of "being to live." This chapter was a profound critique of the ideology of acceleration—an ideology that equates progress with speed and traps humans in an endless cycle of haste and exhaustion. Niyaee, in contrast, defined tranquility not as a luxury, but as a civic right.

In the fourth chapter, water, as a fundamental element of life, structure, and meaning, entered the center of urban design. The water-centric Niyaee City is not an imitation of existing coastal cities, but an offering of a completely novel and systemic model inspired by the

logic of ships, harbors, and currents. Water in this city is both a path of movement, a climate regulator, a foundation for the economy, and an aesthetic element. Transportation by boat, cargo transfer through docks and subsurface networks, and the connection of the economy to water-based industries liberate the city from land-centricity. This chapter demonstrates that the future of cities, especially in the era of climate change, inevitably requires a rethinking of their relationship with water. Niyaee, in this sense, is a precursor to the future of coastal humanity—a humanity that lives with fluidity, balance, and adaptability.

The fifth chapter presented the secure Niyaee City as the practical culmination of this system. Security in this city is achieved not through ubiquitous surveillance, walls, fences, or police control, but through intelligent spatial design. The elimination of automobiles, short access times, clear pathways, the constant presence of people in public spaces, and the elimination of hazardous points have transformed security into the natural state of the city. In Niyaee, children, the elderly, and families move without fear—not because they are being watched, but because there is no threat. This chapter elevated security from a contingency to a

structural concept and demonstrated that a secure city is one in which humans do not need to be in a constant state of readiness.

In conclusion, the Niyaee Planetary City can be understood as a holistic response to the multi-layered crises of contemporary cities: the environmental crisis, the crisis of meaning, the security crisis, the time crisis, and the crisis of the relationship between humanity and technology. Niyaee demonstrates that these crises are not separate from each other and cannot be solved by isolated solutions. What is needed is a paradigm shift in urban thinking—a transition from the city as a machine for production and consumption to the city as a human biosphere.

From a philosophical perspective, Niyaee represents a return to the idea of the "human scale"—a city that adjusts its scale to the body, mind, and perception of humans. From a scientific perspective, Niyaee is an example of convergence between artificial intelligence, complex systems design, and environmental sustainability. From an aesthetic perspective, Niyaee is a city that seeks beauty not in ornamentation, but in harmony, silence, flow, and proportion. And from an ethical perspective, Niyaee is a responsible city—

responsible to future generations, to nature, and to human dignity.

This conclusion is not a point of ending, but a starting point for a global conversation. The Niyaee Planetary City does not claim to be the only possible answer, but demonstrates that different answers are possible—answers that return humanity to the center without denying science and technology. Niyaee reminds us that if the city of the future is to be livable, it must first and foremost be worth thinking about—and this book is an attempt to think about a city in which life once again has value in pausing.

Appendix: Tables

Chapter 1: The Niyaee Planetary City – The Vehicle-Free City

Number	Title	Content
1	Surface Transportation Modes	Smart bicycles, electric and wind-powered scooters, boats, solar gondolas
2	Subsurface Transportation Modes	Autonomous vehicles, clean energy, intersection-free, sign-free
3	Benefits of Eliminating Surface Vehicles	Psychological security, reduced anxiety, increased pedestrian space, reduced noise pollution
4	Algorithm for Vehicle Intelligence	Traffic distribution, maintaining safe distance, route prediction
5	Difference from Modern Cities	Zero traffic, less stress, freedom of pedestrian movement
6	Benefits of Clean Energy	Reduced carbon emissions, reduced air pollution, optimized energy

		consumption
7	Comparison of Travel Times	Surface: Leisurely; Subsurface: Fast and uninterrupted
8	Impact on Physical Health	Daily exercise, increased mobility, reduced obesity and cardiovascular problems
9	Impact on Urban Economy	Reduced commuting costs, increased income for local businesses
10	Human Interaction with the City	Responsive city, tranquil citizens, self-aware city

Chapter 2: The Niyaee Planetary City – An Environment-Focused Urban Ecosystem

Number	Title	Content
1	Energy Resources	Solar, wind, geothermal, and electrical.
2	Industrial Centers	Located outside the city, utilizing clean and low-pollution energy.
3	Pollution Levels	Air: Zero, Noise: Minimal, Soil: Controlled.
4	Green Spaces	Gardens and groves beyond the city limits, urban spaces devoid of trees (Niyaee).
5	Waterways	Regulating humidity, providing recreational opportunities, and facilitating transportation.
6	Reduced Vehicle Use	Eliminating vehicles equates to reduced pollutants and improved health.
7	Mental Wellbeing	Tranquility, stress reduction, an environment-centric approach.

8	Comparison with Modern Cities	Industrial focus within the city, high pollution levels, and the perils of automobiles.
9	Sustainable Tourism	Boating, waterways, and a pleasant climate.
10	Environmental Education	The city as an ecology teacher, fostering environmental awareness among children.

Chapter 3: The Niyaee Planetary City – The Five-Minute City

Number	Title	Content
1	The Five-Minute Accessibility Definition	Services accessible within five minutes by foot or bicycle.
2	Essential Services	Shopping, education, healthcare, recreation, and transportation.
3	Comparison with the Fifteen-Minute Model	Reduced time, faster access, lower density.
4	Transportation Tools	Walking, cycling, scooters, boats, and cable cars.
5	Equitable Access	Accessible to all ages, low-income individuals, and people with disabilities.
6	Human Density	Sufficient for economic vitality, without overcrowding.
7	Technology Utilization	Digital Twin, artificial intelligence, data analytics.

8	Environmental Benefits	Reduced vehicle use, reduced carbon emissions, preservation of air quality.
9	Neighborhood Empowerment	Local economy, vibrant community, active green spaces.
10	Inspiration from Traditional Cities	Neighborhood-centric, return to Iranian patterns, intelligent modernization.

Chapter 4: The Niyaee Planetary City – The Water-Centric City

Number	Title	Content
1	The Water-Centric System	Ship-shaped design, interconnected canals.
2	Commercial Transit	Goods and cargo → Dock → Autonomous vehicles (underground) → Centers.
3	Resident Transportation	Boats, cable cars, bicycles, and scooters.
4	Economic Benefits	Fisheries, fish farming, and aquatic tourism.
5	Water Management	Drinking, industrial, agricultural, and horticultural uses.
6	Impact on Climate	Optimal humidity, air purification, pleasant climate.
7	Tourism	Boating, captivating waterways, beach-centric experiences.
8	Comparison with	Limited access to water, lack

	Modern Cities	of green spaces and canals.
9	Energy Infrastructure	Solar, wind, clean, water-related.
10	Health and Wellbeing	Water sports, mental tranquility, high quality of life.

Chapter 5: The Niyaee Planetary City – The Safe City

Number	Title	Content
1	Absence of Surface Vehicles	Psychological and physical safety, reduced accidents.
2	Five-Minute Accessibility	Elimination of the need for vehicles, rapid services.
3	Safe Transportation	Scooters, bicycles, boats, cable cars, and drones.
4	Benefits of Walking	Physical health, mental tranquility, social interaction.
5	Impact on Children and Seniors	Complete safety, freedom of movement, reduced anxiety.
6	Artificial Intelligence	Management of underground traffic, accident prevention.
7	Safe Urban Spaces	Without horns, intersections, traffic lights, or squares.
8	Social Benefits	Fostering a sense of belonging, reducing stress, increasing neighborhood interaction.

9	Comparison with Modern Cities	Reduced crime, fewer accidents, sustainable safety.
10	The Safe City as a Global Model	A blueprint for designing future cities, inspiring policymakers.

The Niyaee Planetary City vs. Modern Cities

Table 1: Transportation and Traffic

Criterion	The Niyaee Planetary City	Contemporary Modern City	Niyaee Advantage
Surface Vehicles	None	Predominantly free-roaming vehicles	Complete safety, reduced traffic and anxiety
Underground Vehicles	Autonomous, intelligent, clean energy	Often conventional vehicles	Intelligent traffic and energy management
Family Transit	Bicycles, scooters, boats, cable cars	Cars and public transportation	Increased mobility, reduced stress
Intersections & Traffic Lights	Absent	Present	Smooth flow, reduced accidents
Access Time	5 minutes	15-30 minutes	Rapid and efficient access
Traffic Safety	Very High	Lower	Reduced accidents and anxiety

Table 2: Environment and Energy

Criterion	The Niyaee Planetary City	Contemporary Modern City	Niyaee Advantage
Air Pollution	Zero	Higher	Pure air and citizen health
Energy Consumption	Solar, wind, geothermal	Fossil fuels and grid electricity	Reduced carbon emissions and sustainability
Green Spaces	Limited within the city, gardens outside	Trees and parks within the city	Safety, damage control during storms
Waterways	Abundant	Limited	Air purification and urban beauty
Water Management	Intelligent and sustainable	Deficient	Drinking, industrial, and agricultural water supply
Vehicle Reduction	Complete	Partial	Reduced noise and environmental pollution

Table 3: Urban Design and Accessibility

Criterion	The Niyaee Planetary City	Contemporary Modern City	Niyaee Advantage
Access to Services	5 minutes	15 minutes or more	Rapid access, reduced stress and time
Neighborhood Design	Neighborhood-centric, balanced density	Dispersed, car-centric	Healthy community, increased interaction
Human Density	Balanced	Sometimes excessive	Reduced congestion and anxiety
Human Scale	Considered	Often overlooked	Comfortable walking and daily activities
Temporal Urbanism	Yes	No	Time, rather than distance, is the measure
Mixed-Use Development	Residential, commercial, service, and recreational facilities nearby	Zoning separation and dispersion	Easier living, vibrant local economy

Table 4: Economy and Employment

Criterion	The Niyaee –Planetary City	Contemporary Modern City	Niyaee Advantage
Local Economy	Strong and dynamic	Often influenced by large chains	Flourishing small and medium-sized businesses
Water-Based Industries	Active	Limited	Sustainable employment, tourism, and fisheries
Tourism	Canals and boats	Primarily land-based	Engaging and eco-friendly experience
Industrial Use	Outside the city, clean energy	Within and around the city, fossil fuels	Reduced pollution and traffic

Table 5: Health, Wellbeing, and Community

Criterion	The Niyaee Planetary City	Contemporary Modern City	Niyaee Advantage
Physical Health	Increased daily exercise	Widespread inactivity	Reduced risk of heart disease and obesity
Mental Wellbeing	Reduced stress and anxiety	Increased stress	Greater tranquility and satisfaction
Safety	Car-free city	Hazardous city	Complete safety for children and seniors
Social Interaction	Neighborhood-centric, active public spaces	Often isolated and car-dependent	Increased belonging and social cohesion
Lifestyle	Peaceful, human-centric, sustainable	Fast-paced, car-dependent	High-quality, low-stress living

Table 6: Technology and Artificial Intelligence

Criterion	The Niyaee Planetary City	Contemporary Modern City	Niyaee Advantage
Traffic Management	Intelligent, algorithmic, autonomous	Primarily human and traditional	Predictive and optimized routes
Urban Data Analytics	Continuous aggregation and analysis	Limited	Scientific and optimal decision-making
Application Platforms	Comprehensive for all services	Dispersed	Easy and rapid access
Smart Infrastructure	Integrated	Disconnected	Complete coordination of services and transportation
Digital Twin	Simulation of the entire city	Often non-existent	Accurate prediction and crisis management

Table 7: The Five-Minute City and Water-Centric Design

Criterion	The Niyaee Planetary City	Contemporary Modern City	Niyaee Advantage
Access Time to Services	≤ 5 minutes	15 minutes or more	Time and energy savings
Water & City Integration	Canals, boats, beaches	Limited	Beauty, tourism, and water sports
Water Transportation	Active	Limited or non-existent	Reduced traffic pressure, recreation, and trade
Adaptation to Crisis	Flexible, intelligent	Less flexible	Resilience in emergency situations
Tourism	Unique aquatic experience	Traditional	Attracting visitors and economic prosperity

Table 8: Safety and Crisis Prevention

Criterion	The Niyaee Planetary City	Contemporary Modern City	Niyaee Advantage
Urban Accidents	Zero	Higher	Complete Physical Safety
Crimes	Reduced due to active presence	Variable	Safe and Stable Community
Response to Natural Disasters	Clean water and energy channels	Limited	Resilience and Crisis Management
Child Safety	High	Lower	Freedom of Movement and Parental Peace of Mind
Access to Emergency Services	Fast and Intelligent	Limited	Immediate and Effective Response

Final Examination Questions – A Chronicle of Vision

Part I: Forty Reflections on Thought and Analysis

1. How does the absence of automobiles at street level elevate the psychological and physical safety of Niyaee's citizens?
2. How does Niyaee compare to contemporary modern cities in terms of traffic dynamics?
3. What role does artificial intelligence play in the management of subterranean vehicles within the Planetary framework of Niyaee?
4. Why is a five-minute accessibility radius a distinct advantage within the Niyaee paradigm?
5. What is the impact of waterways on the urban climate of Niyaee?
6. How does Niyaee harness clean energies to sustain its existence?
7. What psychological benefits—a reduction in stress and anxiety—does Niyaee offer its inhabitants?

8. Explain the relationship between a water-centric city and urban tourism within the Niyaee vision.
9. How does Niyaee strengthen the local economy, fostering a vibrant and self-sufficient community?
10. What is the concept of “time-based urbanism,” and why is it crucial to the Niyaee model?
11. What methods have been employed within Niyaee to reduce carbon emissions and mitigate environmental impact?
12. What role does balanced human density play in shaping the urban experience within Niyaee?
13. How does equal access to services within Niyaee promote social justice and equity?
14. Illustrate the difference between a five-minute city and a fifteen-minute city, using examples from Niyaee.
15. Why is Niyaee designed without intersections or traffic lights, creating a seamless flow of movement?
16. What is the role of digital twin technology in

managing the complexities of Niyaee?

17. How can Niyaee inspire the urban planning of the future, serving as a beacon of sustainable design?

18. What is the significance of mixed-use developments (residential, commercial, recreational) located in close proximity within Niyaee?

19. What lessons are drawn from Niyaee's experience in designing sustainable cities?

20. What is the relationship between a water-centric city and environmental sustainability within the Planetary context of Niyaee?

21. How can Niyaee contribute to reducing accidents and crime rates within its urban environment?

22. What are the advantages of using scooters, bicycles, and boats for urban transportation in Niyaee?

23. Explain the relationship between a five-minute city and a healthy lifestyle within Niyaee.

24. How can neighborhood-centric design strengthen social interaction and community bonds in Niyaee?

25. What are the negative effects of automobiles in modern cities, and how does Niyaee avoid them?

26. Why does Niyaee rely on a ship-like model for the transport of goods and cargo?

27. What role do gardens and trees located outside the city play in improving air quality within Niyaee?

28. How can Niyaee enhance urban resilience in the face of crises and unforeseen challenges?

29. What lessons from the history of traditional Iranian cities have been incorporated into the design of Niyaee?

30. How is the relationship between aesthetics and functionality expressed in the urban design of Niyaee?

31. How does Niyaee ensure the safety and well-being of children and the elderly?

32. What are the benefits of digitalization and urban

applications within the Niyaee ecosystem?

33. How does Niyaee strengthen the economy of tourism and water-centric industries?

34. What is the relationship between physical health and reduced reliance on automobiles in Niyaee?

35. What factors contribute to the reduction of anxiety and stress within the Niyaee environment?

36. What role do canals and boats play in shaping the spatial and psychological experience of Niyaee's citizens?

37. How does Niyaee leverage artificial intelligence algorithms to manage traffic flow?

38. Why is the physical and psychological safety of Niyaee's citizens elevated?

39. How can urban design contribute to social justice and reduce inequalities within Niyaee?

40. How is the future of sustainable and human-centric cities intertwined with the vision of Niyaee?

Part II: Forty Practical Exercises

1. Design a five-minute route from your home to your school on a map of Niyaee.
2. Plan a day's itinerary utilizing a scooter or bicycle within the urban landscape of Niyaee.
3. Design a simple algorithm for managing subterranean vehicles within the Planetary framework.
4. Create a basic digital twin model for a neighborhood within Niyaee.
5. Illustrate a detailed route for transporting goods from the docks to the city center.
6. Mark the locations of green spaces and waterways on a map of Niyaee.
7. Calculate the time savings achieved through a five-minute accessibility radius.
8. Design a daily family program incorporating boats and cable cars within Niyaee.
9. Draw a diagram illustrating the local economic flow within Niyaee.

10. Design an algorithm for distributing solar and wind energy throughout Niyaee.

11. Illustrate the water flow model for a water-centric city on a map.

12. Prepare an emergency management plan with a scenario of an urban crisis.

13. Design a walking route for the elderly within a neighborhood of Niyaee.

14. Build a multi-layered transportation model (subterranean and surface) for Niyaee.

15. Draw a comparative graph of air pollution levels between Niyaee and a modern city.

16. Simulate the use of an urban application for accessing services within Niyaee.

17. Prepare a time management plan for reaching services within five minutes.

18. Create a recreational itinerary for a family using bicycles and boats in Niyaee.

19. Design a diagram illustrating social interaction within a neighborhood.

20. Build an algorithm to reduce congestion in a neighborhood using artificial intelligence.
21. Optimize the route of boats in the waterways of Niyaee.
22. Design a diagram illustrating human density in neighborhoods.
23. Create an educational program for children in a car-free city.
24. Design a sustainable tourism model focused on canals and boats within Niyaee.
25. Illustrate a route for transporting food and goods within Niyaee.
26. Create a table comparing energy consumption for subterranean vehicles and scooters.
27. Design a map of access to emergency services.
28. Build a graph comparing physical and psychological health with reduced reliance on automobiles in Niyaee.
29. Prepare an algorithm for allocating water resources for agriculture, gardens, and urban

consumption.

30. Design a simulation application for subterranean traffic.

31. Model the flow of tourists in canals and on the waterfront.

32. Design a diagram of the economy of water-centric industries and fisheries.

33. Prepare a daily schedule for a citizen walking and cycling in Niyaee.

34. Design an algorithm for prioritizing urban maintenance and repairs.

35. Analyze a map of high-risk and low-risk areas in a car-free city.

36. Build a simulation scenario for a flood or storm crisis.

37. Design a diagram of energy efficiency in buildings and neighborhoods.

38. Design an algorithm for distributing urban services within a five-minute radius.

39. Create a table comparing the quality of life in Niyaee and a modern city.

40. Design an educational or cultural program to familiarize citizens with the Niyaee lifestyle.
